# SOUTH AFRICAN COMMERCIAL MAIZE QUALITY

2006/2007

## Acknowledgments

### *With gratitude to:*

- \* **The Maize Trust for its financial support in conducting this survey.**
- \* **The Grain Silo Industry and its members in providing the samples to make this survey possible.**

## Introduction

The calculated final commercial crop figure for maize for the 2006/2007 season by the National Crop Estimates Committee was 7 125 000 tons. This is 7,7 % higher than the previous season's 6 618 000 tons. The average production from 1996/97 to 2005/06 was 8,63 million tons. The major maize-producing region was the Free State (2 787 000 tons), followed by Mpumalanga (1 441 500 tons) and the North West (1 271 500 tons). White maize contributed 60 % to the total production, which is 2 % less than the previous year.

900 composite samples, proportionally representing white and yellow maize of each production region, were analysed for quality. All samples were graded according to RSA and USA grading regulations. 100 kernel mass, kernel size, breakage susceptibility, stress cracks, milling index, fat, protein and starch were determined on all samples. Roff milling and whiteness index were done on white maize samples. Mycotoxin analyses as well as testing for GM maize were performed on 90 samples representative of white and yellow maize produced per region.

The 900 samples analysed consisted of 563 white maize samples and 337 yellow maize samples. Of the 563 white maize samples analysed, 81 % were WM1, 12 % WM2, 7 % WM3 and only four samples were of the Class Other Maize white. Of the 337 yellow maize samples analysed, 78 % were YM1, 18 % YM2, 2 % YM3 and eight samples were of the Class Other Maize yellow.

The maize crop quality survey is annually done by the Southern African Grain Laboratory (SAGL).

## Crop quality

This crop was of good quality and 80 % of the crop graded as maize grade 1. Smaller size kernels were distinctive of this crop. The defective deviation that occurred the most above the 6,35 mm sieve, was discolouration that exceeds the normal browning at the connection tip, this is caused by water damage.

The kernel size were markedly smaller than previous seasons and the 100 kernel mass averaged 28,9 g (4,0 g lower than the previous season). The average hectolitre mass was 77,5 kg/hl (75,9 kg/hl during 2005/2006).

The average percentage of total defective kernels of 5,1 % was lower than the previous season's 7,8 %.

The average fat content was 3,7 % (db), average starch content 73,0 % (db) and average protein 9,4 % (db). The average fat content were lower than the ten year average of 4,0 % (db), the average protein content were 0,5 % higher than the ten year average. The average starch content increased from 71,2 % (db) the previous season to 73,0 % (db).

The average milling index was 98,3 about 7 higher than the previous season's 90,8. This indicate slightly better extraction even with the smaller kernels.

Very little visual fungi such as *Fusarium sp.* and *Diplodia sp.* were present and the mycotoxin levels averaged lower than in previous seasons.

Ninety-seven percent of the samples tested positive for MON 810 (Bt maize event) and fifty-nine percent positive for NK 603 (RUR).

## **Maize quality (Summary)**

### **Overall**

The white maize graded slightly better than the yellow maize and had an average hectolitre mass of 78,1 kg/hl while the yellow maize averaged 76,4 kg/hl. White maize had bigger kernels than the yellow maize.

Yellow maize had a slightly lower fat content (3,5 % (db)) than white maize (3,9 % (db)), while the starch content in yellow maize (73,3 % (db)) were slightly higher than in white maize (72,9 % (db)). The average protein content in white maize was 9,3 % (db) and in yellow maize 9,5 % (db).

### **Main production regions**

The maize quality of the three main maize producing provinces differed in some aspects.

#### **Free State**

This province produced 40 % of all the commercial maize in South Africa, of which 67 % was white maize and 33 % yellow maize.

The weighted average percentage total defective kernels for the Free State was 4,4 %. North West averaged 7,2 % and Mpumalanga 3,9 %.

The maize produced in the Free State averaged a hectolitre mass of 77,9 kg/hl. (North West 77,5 kg/hl and Mpumalanga 76,3 kg/hl.) The white maize in the Free State averaged 78,4 kg/hl and the yellow maize 76,0 kg/hl.

The 100 kernel mass for the Free State averaged 29,2 g, with the white maize averaging 30,1 g and the yellow maize 27,0 g. (Mpumalanga and North West averaged 27,0 g and 29,0 g respectively.)

This province had the “largest” kernel size with an average of 14,9 % of the maize having kernels > 10mm. (Mpumalanga was 12,8 % and North West 14,2 %.)

Stress cracks were the lowest in the Free State (2,7 %), then the North West with 3,1 %, and Mpumalanga had 3,8 %.

The average milling index in the Free State

was 98,3 %, 101,4 % in North West and 94,5 % in Mpumalanga.

#### **Mpumalanga**

This province produced 21 % of the total commercial maize production in South Africa, of which 49 % was white maize and 51 % yellow maize.

In all three provinces white maize averaged about 3 g higher 100 kernel mass than yellow maize, while the hectolitre mass of white maize averaged about 2 kg/hl higher than yellow maize.

The maize kernels produced in Mpumalanga had an average breakage susceptibility of 1,9 g passing through the 6,35 mm sieve while the Free State and Mpumalanga had averages of 1,5 g and 1,9 g respectively passing through the 6,35 mm sieve.

All three provinces gave an average fat content between 3,5 % and 3,9 %. The starch content in these three regions averaged between 72,5 % to 73,3 %.

Mpumalanga had the lowest incidence of both Fumonisin and Deoxynivalenol.

#### **North West**

This province produced 18 % of all the commercial maize grown in South Africa, of which 83 % was white maize and 17 % yellow maize.

The average defective kernels for North West above the 6,35 mm sieve averaged the highest with 5,1 %, the Free State followed with 2,1 % and Mpumalanga with 1,9 %. The average defective kernels below the 6,35 mm sieve for all three regions were more or less the same.

The North West gave the highest average protein of 9,7 % (db), followed by the Free State (9,4 %) and Mpumalanga (9,3 %).

The white maize from North West gave the highest average whiteness index of 20,4 (sifted 87:13). (The Free State had an average of 21,1 and Mpumalanga 19,2).

North West had the highest incidence of Fumonisin while Free State had the highest incidence of Deoxynivalenol.

## Production regions

The RSA is divided into 36 grain production regions. Regions 1 to 9 are winter rainfall areas (Western Cape), as well as the Eastern Cape and Karoo where very little commercial maize is being produced.

Region 10 is Griqualand West and region 11 Vaalharts. Regions 12 to 20 are all within the North West.

Regions 21 to 28 are in the Free State. The Free State contributed 40 %, Mpumalanga (regions 29 to 33) contributed 21 % and the North West contributed 18 % of the total production. These contributions make up 79 % of the total maize production in the RSA.

Region 34 falls within Gauteng, region 35 within the Limpopo Province and region 36 within KwaZulu-Natal.

## Sampling

All the samples tested and received from the grain storers are drawn in the following way:

With each consignment at the silos a 10 kg grading sample is drawn for grading purposes according to the Grading Regulations.

After the grading sample has been divided, 500 g of the 10 kg sample are thrown into a 50 kg bag representing a certain class and grade. When this bag is full, it is divided and a 5 kg sample according to class and grade per silo bin is sent to the SAGL.

Only three samples were received from the millers who receive about 15 % of the maize crop directly from the producers.

## South African Provinces

## **Genetic Modification**

Annually the SAGL screen 10 % of the crop samples to test for MON 810 (Bt maize event) and NK 603 (RUR).

The methodology the SAGL uses is a quantitative enzyme-linked immuno sorbent assay. The SAGL does however not report quantities recorded below the limit of detection and above the value of the reference standards used, the reason being that the methodology can not accurately measure beyond those values. MON 810 were positively identified in 97 % of the samples tested and NK 603 in 59 % of the samples tested. Please note that the crop quality samples received by the SAGL are actually composite samples made up by the silos per class and grade of individual deliveries.

## **Mycotoxins**

Aflatoxin was detected on three randomly selected crop samples. Thirteen samples tested positive for Ochratoxin A.

The Fumonisin average was 0,64 ppm. Eight samples tested higher than 2,0 ppm for Fumonisin with a maximum of 4,5 ppm.

Deoxynivalenol (DON) was detected in 47 % of the samples tested, giving an average of 0,5 ppm, with a maximum of 3,1 ppm.

None of the ninety samples showed any traces of Zearalenone.

## **Imported Maize**

South Africa has imported in total 1 073 511 tons of yellow maize from Argentina as on 15/02/2008 for the 2006/2007 production season and 27 950 tons of white maize from African countries. (Season ends on 30/04/2008.) (SAGIS website.)

The quality data of the imported maize compared to the average quality of the RSA maize of the same class and grade for this season are given on pages 51 and 52.

## **2006/2007 Imported maize (up to 01/02/2008)**

Eighty-seven maize samples from imported maize were analysed up to 01/02/2008. Of these maize, four samples graded as YM2 and eighty-three samples graded as Class Other Maize.

The major downgrading factor of imported maize to YM2 was the high percentage of defective kernels below the 6,35 mm sieve.

Imported maize downgraded to Class Other Maize were mainly due to the high percentage of pimpled maize kernels.

The imported YM2 had an average hectolitre mass of 77,1 kg/hl while RSA YM2 had an average hectolitre mass of 74,4 kg/hl.

The imported maize even had smaller kernels than this season's local crop characterized by small kernels.

The average weighted fat content of the imported maize (4,7 % (db)) were higher than the average of the same RSA grade maize (3,5 % (db)), while the RSA maize gave a slightly higher protein content and a markedly better starch content.

Most quality tendencies are similar to the previous season.

The imported maize had an average total Aflatoxin of 0,43 ppb ( $\mu\text{g}/\text{kg}$ ) with a maximum of 9,0 ppb in a sample.

The average Fumonisin content of imported maize were 1,66 ppm (mg/kg) with a maximum of 5,30 ppm. RSA maize in that same class and grade averaged 1,05 ppm Fumonisin and a maximum of 4,50 ppm.

RSA maize of the same class and grade this season had an average Deoxynivalenol (DON) content of 0,96 ppm with a maximum of 2,10 ppm, while the imported maize had an average of 0,84 ppm and a maximum of 2,80 ppm DON. The averages values of Ochratoxin A and Zearalenone of imported maize were low while none of these mycotoxins were traced this season in RSA YM2 and RSA COM maize.

## Grain Production Regions

With each region is given the different Grain Handlers with specific silos.

**TABLE 10: GRADES AND GRADE REQUIREMENTS FOR MAIZE ACCORDING TO RSA GRADING REGULATIONS**

Description of deviation		Maximum percentage of deviation allowed (m/m)					
		White maize			Yellow maize		
		GRADE					
		WM1	WM2	WM3	YM1	YM2	YM3
I	Defective maize kernels above 6,35 grading sieve	7	13	30	-	-	-
	below 6,35 mm grading sieve	-	-	-	9	20	30
II	Maize kernels of another colour	3	6	10	2	5	5
III	Foreign matter (excluding stone, pieces of coal or glass and dung)	0,3	0,5	0,75	0,3	0,5	0,75
IV	Total deviations in terms I, II and III collectively, provided such deviations are individually within the limits specified above	8	16	30	9	20	30
V	Pinked maize kernels	12	12	12	12	12	12

If the maize does not comply with the standards for Class White Maize or Class Yellow Maize, it shall be classified as Class Other Maize.

**TABLE 11: GRADES AND GRADE REQUIREMENTS FOR MAIZE ACCORDING TO USA GRADING REGULATIONS**

Grades	Minimum test weight per bushel (pounds)	Maximum limits of -		
		Heat damaged kernels (percent)	Total (percent)	Broken corn and foreign material (percent)
U.S. No. 1	56.0	72.1 kg/hl	0.1	3.0
U.S. No. 2	54.0	69.5 kg/hl	0.2	5.0
U.S. No. 3	52.0	66.9 kg/hl	0.5	7.0
U.S. No. 4	49.0	63.1 kg/hl	1.0	10.0
U.S. No. 5	46.0	59.2 kg/hl	3.0	15.0
U.S. Sample Grade	< 46.0	<59.2 kg/hl	>3.0	>15.0
U.S. Mix Grade	When % other colour in yellow maize samples >5 % and white maize samples >2 %			

U.S. Sample grade is corn that:

- a) Does not meet the requirements for the grades U.S. Nos. 1, 2, 3, 4 or 5; or
- b) Contains 8 or more stones which have an aggregate weight in excess of 0.20 percent of the sample weight, 2 or more pieces of glass, 3 or more crotalaria seeds (Crotalaria ssp.), 2 or more castor beans (Ricinus communis L.), 4 or more particles of an unknown foreign substance(s) or a commonly recognized harmful or toxic substance(s), 8 or more cockleburs (Xanthium ssp.) or similar seeds singly or in combination, or animal filth in excess of 0.20 percent in 1000 grams; or
- c) Has a musty, sour, or commercially foreign odor; or
- d) Is heating or otherwise of distinctly low quality.

Source: Official United States Standard of Grain (excluding metric conversions.)

## Genetic modification

Ten percent (90 samples) of this crop samples (crop samples are made up of individual deliveries) were tested for the presence of MON 810 (Bt maize event) and NK 603 (RUR). The limit of detection for the MON 810 methodology used is 0,15 %. The highest reference standard is 2,0 % and the accuracy of results can only be guaranteed up to 2,0 %.

Ninety-seven percent of the samples tested positive for MON 810 with values larger than 0,15 % (LOD).

The limit of detection for the NK 603 methodology used is 0,25 %. The highest reference standard is 1,8 % and the accuracy of the results can only be guaranteed up to 1,8 %. Fifty-nine percent of the samples tested positive with values larger than 0,25 % (LOD).

## Methods

### 1. Grading

#### 1.1 RSA grading

RSA grading was done in accordance with the Grading Regulations for maize, as published in the Government Gazette No. 19131 of 14 August 1998, regulation No. R.905.

#### Description of deviations relating to RSA grading

##### a. Defective maize kernels

The term “defective kernels” means all maize kernels and pieces of maize kernels which are shrivelled, obviously immature, frost-damaged, heat-damaged, mouldy or discoloured, have sprouted (including kernels whose growing point in the germ is visibly discoloured), have cavities in the germ or endosperm caused by insects or rodents, are visibly contaminated by smut, soil, smoke or coal-dust, can pass through the 6,35 mm round-hole sieve, are clearly of inferior quality and of subspecies other than *Zea mays indentata* or *Zea Mays indurata*.

##### b. Foreign matter

The term “foreign matter” means all matter other than maize, glass, stone, coal, dung or metal.

##### c. Other colour

The term “other colour” means maize kernels of a colour other than white or yellow but excludes pinked maize kernels.

##### d. Total deviation

The term “total deviation” means the total defective kernels plus foreign matter plus other colour kernels.

##### e. Pinked kernels

The term “pinned kernels” means maize kernels whose endosperm is white or yellow and whose pericarp or part thereof is red or pink in colour.

The specification, according to the Grading Regulations for classes 1 to 3 of white and yellow maize is a maximum of 12 %.

#### Fungal infection

All samples were inspected for the visual symptoms of Diplodia and Fusarium cobrot. There are four fungi which cause cobrot in South Africa namely Stenocarpella maydis (Diplodia maydis), Fusarium moniliforme, Fusarium graminearum and Stenocarpella macrospora(Diplodia Macrospora).

Fusarium spp infections are localized on the cob with discoloured maize kernels, which become reddish (light pink to lilac). Diplodia maydis normally rots the entire maize cob and infected maize kernels are recognized by a light ash colour to black colour that appears at the germ and can infest the whole kernel.

#### 1.2 USA grading

USA grading was determined in accordance with the method of the American Grading Regulations (United States Department of Agriculture).

There are seven grades or standards in US grading, Grades nos. 1 to 5, sample grade and mixed grade. No.1 is the most desirable followed by no. 2 down to sample grade and mixed grade.

#### Description of deviations relating to USA grading

##### a. Damaged kernels

Kernels and pieces of corn kernels that are badly ground-damaged, badly weather-damaged, diseased, frost-damaged, germ-damaged, heat-damaged, insect-bored, mould-damaged, sprout-damaged or otherwise materially damaged.

##### b. Heat-damaged kernels

Kernels and pieces of kernels which are materially discoloured by excessiverespiration, with the dark discoloration extending out of

the germ through the sides and into the back of the kernel as well as kernels and pieces of kernels which are puffed or swollen and materially discoloured by external heat caused by artificial drying methods.

b. Broken corn and foreign material

Broken corn is all matter that passes readily through a 12/64-inch (4,76 mm) round-hole sieve and over a 6/64-inch (2,38 mm) round-hole sieve.

Foreign material is all matter that passes readily through a 2,38 mm round-hole sieve and all matter other than corn that remains on top of the 4,76 mm round-hole sieve after sieving.

Broken corn and foreign material is all matter that passes readily through a 4,76 mm round-hole sieve and all matter other than corn that remains in the sieved sample.

c. Bushel weight (Hectolitre mass)

Bushel weight is specified as a grading factor in the USA Grading Regulations.

Hectolitre mass was determined on the maize crop samples and the bushel weight spec in the USA Regulations converted to hectolitre mass by multiplication with a factor of 1,2872 to enable the grading of the samples according to the USA Grading Regulations.

d. Other colour

Maize samples are deemed to be mixed grade when maize kernels of another colour for white maize exceeds 2 % and for yellow maize exceeds 5 %.

## 2. Nutritional value

The Infratec 1241 Grain Analyzer (Near Infrared) (NIT) was calibrated against the different international chemical methods for determining nutritional values.

The chemical methods used to establish a set of calibration samples were:

a) for fat, the petroleum ether extraction (Soxhlet) method (AACC 30-25, 1999),

b) for protein, the Dumas (Leco) method (AACC 46-30,1999), and  
c) for starch, the Hydrochloric Acid dissolution method (Polarimeter) In house method 019 (Zeiss Polarimeter manual).

These sets of calibration samples were used to calibrate the Infratec 1241 Grain Analyzer (NIT) and results were checked by analysing every tenth sample by means of the primary methods.

## 3. Physical characteristics

### Hectolitre mass

Hectolitre mass (grain density) means the mass in kilogram per hectolitre.

### 100 kernel mass - Industry accepted method 001

100 kernel mass is the weight in grams of one hundred whole maize kernels and provides a measure of grain size and density.

### Kernel size - Industry accepted method 017

Kernel size is important to the sophisticated starch manufacturing industry. Kernels that are too small hamper the separation of kernel fractions in the wet milling process. The result is a lower starch yield. A mixture of small and large kernels causes additional problems, as homogeneous steeping cannot be achieved. On the other hand, very large kernels can also cause problems since the ratio between volume and mass is unfavourable to proper steeping.

The dry milling industry also prefers fairly larger maize kernels. However, a uniform kernel size is of particular importance to this industry, as kernels that are too large create problems especially when mixed with smaller kernels.

Kernel size is less important to the animal feed manufacturing industry. Larger kernels are nevertheless preferred, as small kernels

are easily lost during the screening stage of processing. The determination of kernel size comprises the sieving of a 100 g representative whole maize sample through both 8 mm and 10 mm round-hole grading sieves, normally used in the seed industry.

#### **Breakage susceptibility - Industry accepted method 007**

Maize is normally cleaned before processing. In the cleaning process, broken kernels are removed with other impurities, causing losses. Broken kernels are further broken during handling, resulting in much grain dust being generated. This creates the potential for dust explosions, health hazards, hygiene problems and so forth. Maize containing a high percentage of broken kernels tends to become insect infected more easily and is subject to general deterioration.

In the modern dry milling industry, maize is first cleaned and then conditioned by dampening before the germ is removed. Broken kernels cause many problems during these stages of processing. Broken kernels can also lead to a lower extraction of the so-called high-quality products, like samp and maize grits. The presence of many broken kernels cause problems with the fibre and fat content of other maize products, like the various grades of maize meal, because the quantity of germ required to be returned to the milled endosperm cannot be accurately determined.

In the wet milling process broken kernels steep more rapidly than whole kernels and by the time the whole kernels have been sufficiently steeped, the broken kernels have been oversteeped, causing an ineffective separation of protein and starch.

In the livestock feed industry breakability is not an important quality characteristic, except for dust and hygiene problems. Every sample was subjected to a breakage susceptibility test. After the sample of whole

maize kernels was propelled in a Stein Breakage tester for 4 minutes, the fraction below the 6,35 mm and 4,75 mm sieve was collected and the percentage broken kernels < 6,35 mm and < 4,75 mm was determined.

#### **Stress cracks - Industry accepted method 006**

Stress cracks are determined by visual inspection of a certain amount of whole maize kernels examined on top of a light box for small internal cracks in the endosperm. Some kernels may even have two or more internal cracks. Any form of stress may cause internal cracks, for example rapid moisture loss on the land, during harvest or during drying. Stress cracks are genetic and different cultivars will differ.

#### **Milling index - Industry accepted method 015**

Milling index is an indication of the milling abilities and milling quality of maize kernels where a higher milling index means a higher extraction of the high-grade and most profitable products like samp, maize rice and maize grits (degermed products) that are manufactured from the corneous part of the endosperm. The milling index is an indication of the relative differences between samples tested. The milling index is measured with the Infratec 1241 Grain Analyzer. The SAGL uses a calibration developed by the Grain Crops Institute of the ARC.

#### **Whiteness index - Industry accepted method 004**

Whiteness index of white maize meal was determined with the Hunterlab colorflex 45°/0°. Whiteness is associated with a region or volume in colour space in which objects are recognized as white. The degree of whiteness is measured by the degree of departure of the object from a perfect white. The higher the whiteness index value the whiter the sample.

## Milling of maize on Roff maize mill - Industry accepted method 013

The Roff 150 Series maize mill is used to mill representative samples of 500 g. The mill should be pre-set to the following specifications: Break 1 roll nip - 0.3 mm, Break 2 roll nip - 0.18 mm and Break 3 roll nip - 0.08 mm. These settings are according to the specifications in the method developed by the ARC Grain Crops Institute. Every mill has three separations, namely germ, grits and maize meal. The grits from Break 1 are transferred to the Break 2 rolls and the grits from Break 2 are transferred to Break 3 rolls. The following fractions are weighed and determined as percentage:

Break 1 meal

Break 2 meal

Break 3 meal

Break 3 grits

Break 1, 2 and 3 germ and bran are combined and then weighed for determination of Bran/Germ %.

Break 3 grits is weighed for determination of % Grits.

Break 1, 2 and 3 meal are combined and weighed for determination of % extraction total meal.

## 4. Mycotoxin analyses

The pathogenic nature of certain species of fungi to plants has been observed virtually since the beginning of agriculture. These

plant pathogens can produce metabolites (mycotoxins) that show toxic effects when they are ingested.

The mycotoxin analyses were carried out in accordance with the Vicam immunoaffinity column technique using the different Vicam Instruction Manuals for the different mycotoxins. Detection of the toxins was done on a Fluorometer. 90 samples of the 900 maize crop samples were tested for Aflatoxin, Fumonisin, Deoxynivalenol, Zearalenone and Ochratoxin.

## 5. GMO (Genetically Modified Organisms)

90 samples of the 900 maize crop samples were tested for Bt (MON 810) and RUR (NK 603) Modified maize. Quantitative analyses for MON 810 maize were done using the procedure supplied with the Strategic Diagnostics Incorporated GMO Bt maize test kit. Cry 1 Ab protein in corn is produced from a gene derived from *Bacillus thuringiensis* (Bt). This method is a quantitative enzyme-linked immunosorbent assay (ELISA) test for the determination of Bt modified corn in corn flour. Proprietary antibodies specific for Cry 1 Ab protein are used.

The GMO Soya test kit from Strategic Diagnostics Incorporated (SDI) were used to quantitatively determine Roundup Ready (RUR). The procedure was adapted by SDI for maize.
