SOUTH AFRICAN COMMERCIAL SOYBEAN QUALITY FOR THE 2014/2015 SEASON

Acknowledgements

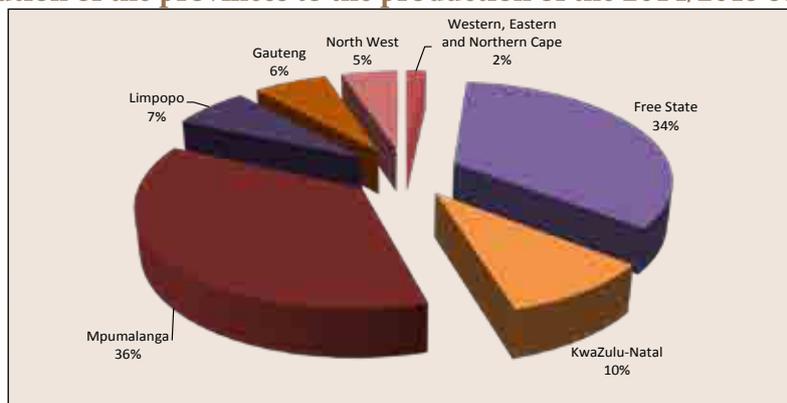

With gratitude to:

- *The Oil & Protein Seed Development Trust for its financial support in conducting this survey.*
- *Agbiz Grain and its members for their cooperation in providing the samples to make the survey possible.*
- *The Crop Estimates Committee (CEC) of the Department of Agriculture, Forestry and Fisheries for providing production related figures.*
- *South African Grain Information Service (SAGIS) for providing supply and demand figures relating to soybeans.*

Introduction

The highest South African soybean crop ever was produced during the 2014/2015 season. The final commercial figure as overseen by the National Crop Estimates Liaison Committee (CELC) is 1 070 000 tons. The final calculated crop figure was adjusted upward by 10 150 tons (0.96%). The commercial soybean crop increased by almost 13% (122 000 tons) from the 2013/2014 season. The major soybean-producing provinces, contributing 70.6% of the total crop, were Mpumalanga and the Free State.

Graph 1: Contribution of the provinces to the production of the 2014/2015 soybean crop

Figures provided by the CEC.

During the harvesting season, a representative sample of each delivery of soybeans at the various silos was taken according to the prescribed grading regulations. The sampling procedure for the samples used in this survey is described on page 25. One hundred and fifty composite soybean samples, representing the different production regions, were analysed for quality. The samples were graded, milled and analysed for moisture, crude protein, crude fat, crude fibre and ash content. Fifteen randomly selected samples were analysed to quantitatively determine the presence of genetically modified soybeans.

The goal of this crop quality survey is the compilation of a detailed database, accumulating quality data collected over several seasons on the national commercial soybean crop, which is essential in assisting with decision making processes. The data reveal general tendencies, highlight quality differences in the commercial soybeans produced in different local production regions and provide important information on the quality of commercial soybeans intended for export.

This is the fourth annual soybean crop quality survey performed by The Southern African Grain Laboratory NPC (SAGL). SAGL was established in 1997 on request of the Grain Industry. SAGL is an ISO 17025 accredited testing laboratory and participates in a number of proficiency testing schemes, both nationally and internationally, as part of our ongoing quality assurance procedures to demonstrate technical competency and international comparability.

The results of this survey are available on the SAGL website (www.sagl.co.za). The hard copy reports are distributed to all the Directly Affected Groups and interested parties. The report is also available for download in a PDF format from the website.

In addition to the quality information, production figures (obtained from the Crop Estimates Committee (CEC)) relating to hectares planted, tons produced and yields obtained on a national as well as provincial basis, over an eleven season period, are provided in this report. SAGIS (South African Grain Information Service) supply and demand information over several years is provided in table and graph format.

The 2014/15 Report of the National Soybean Cultivar Trials conducted by the ARC-Grain Crops Institute in Potchefstroom is also included in this report, as is the national grading regulations as published in the Government Gazette No. R.478 of 20 June 2014.

Production

Soybeans are the most important oilseed crop produced in South Africa. Since the 2007/2008 season a steady increase in hectares planted has been observed as producers became aware of the benefit of soybeans in crop rotation programs, especially as part of conservation agriculture. Soybeans also have lower input needs compared to other commodities like maize and wheat.

The 2014/2015 production season was extremely trying for farmers with wet and dry periods alternating outside the normal patterns. Despite this fact, the area utilized for soybean production increased from 502 900 hectares in the previous season to 687 300 hectares this season. The significant impact of the drought experienced this season, is shown by comparing the 37% increase in area, with the 13% increase in production, resulting in a yield decrease of 1.89 t/ha in 2013/2014 to 1.56 t/ha.

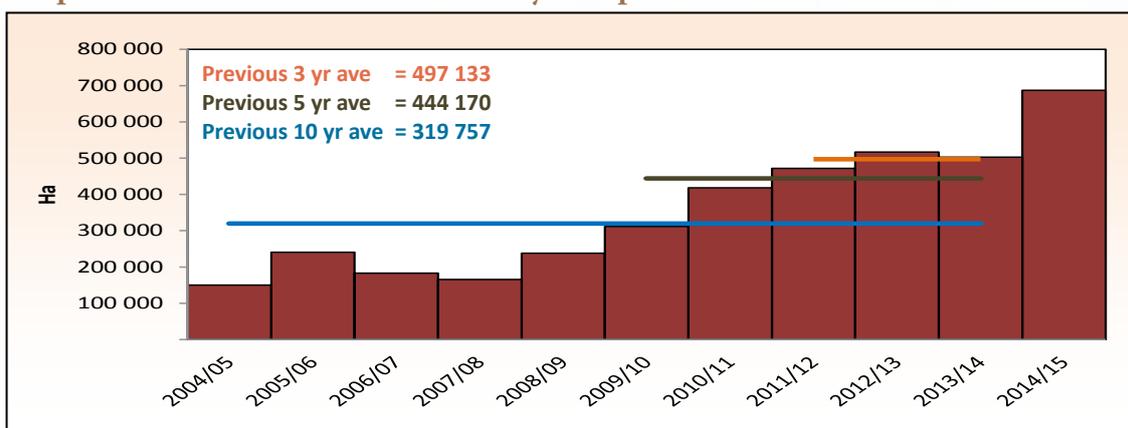

Province	Type of production	2014/2015			2013/2014

Figures provided by the CEC.

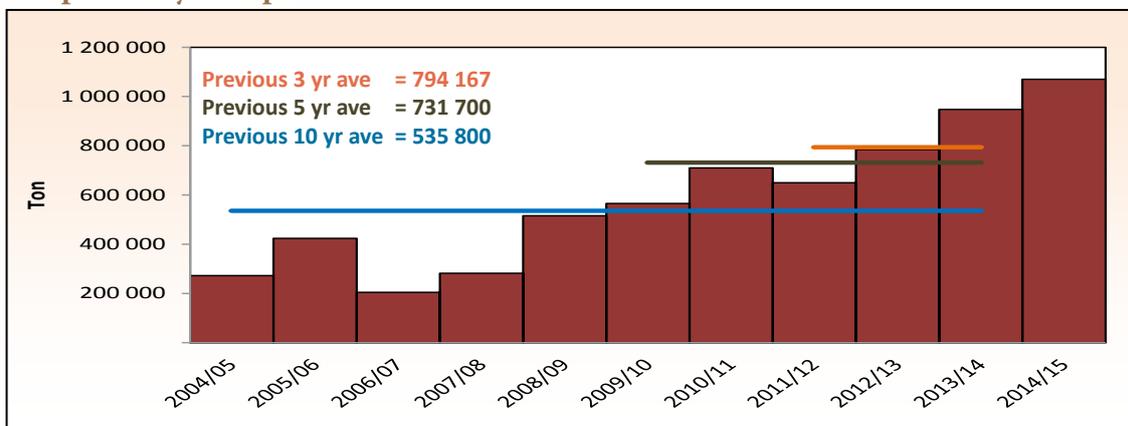

According to the *BFAP Baseline, Agricultural Outlook 2015 – 2024*, the area utilized for soybean production in South Africa is projected to continue its increasing trend over this baseline period. By 2024 the area under soybean cultivation is expected to surpass 1 million hectares and the production projected to surpass 2.1 million tons.

The 2014/2015 soybean crop in Argentina and Brazil being larger than expected, resulted in global oilseed production exceeding previous records for the second consecutive season. Soybeans represent more than half of the world oilseed production. According to the *World Agricultural Supply and Demand Estimates Report (WASDE)* an estimated 318.80 million metric tons of soybeans were produced during the 2014/2015 season. The United States contributed 34%, Brazil 30% and Argentina 19% to this total. The world soybean production during the 2015/2016 season is projected to be 320.51 million metric tons.

— Eleven year average

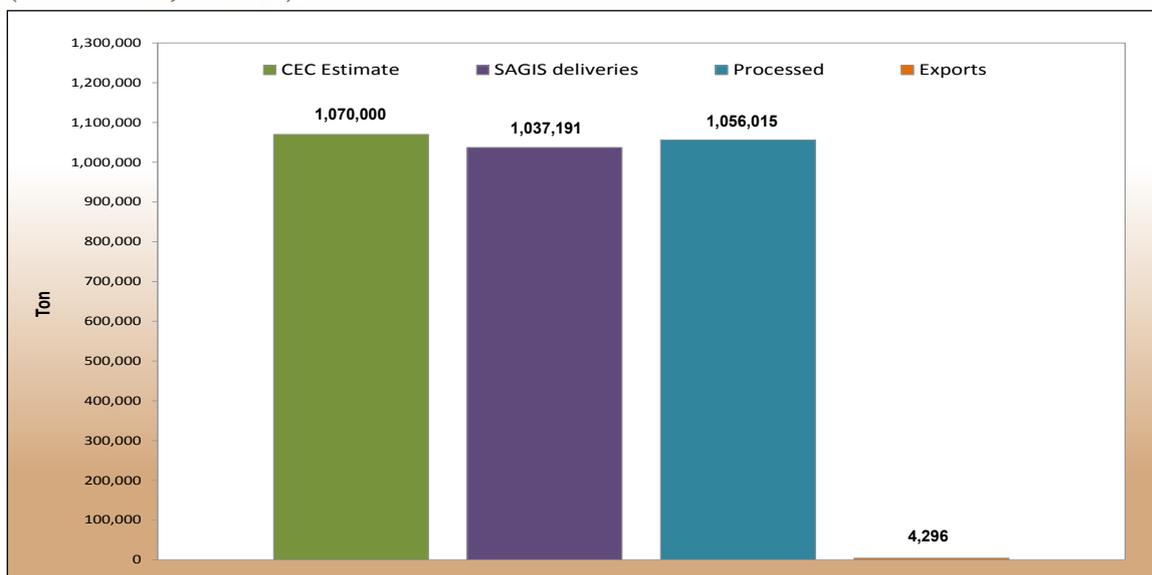

Supply and Demand

The soybean marketing season dates from March to end of February. According to SAGIS supply and demand figures for the 2015/2016 marketing season to date (March 2014 to January 2015), imports increased by more than 20 000 tons to 124 981 tons. South Africa remain a net importer of vegetable oils. Of the 1 056 015 tons of soybeans processed to date, 2.1% was used for human consumption, 10.8% for animal feed as full fat soya and 87.1% was crushed to produce oil or oilcake. The amount of soybeans crushed so far increased with 6.7% (58 083 tons) compared to the 2014/2015 season.

According to *BFAP Baseline*, just over 800 000 tons of soybean oilcake will have been produced locally during 2015, which constitutes 63% of the projected consumption of just over 1.2 million tons. The balance of the demand will be imported. The total crushing capacity derived from dedicated soybean crushers locally is estimated at 1.75 million tons. More than half of the consumed soybean oilcake will have been produced locally for the second successive year (2015). By 2024, domestic soybean oilcake production is projected to exceed 1.6 million tons, which represents 87% of the total projected soybean oilcake consumption of 1.8 million tons. An expansion of 35% in domestic demand over the next decade implies that South Africa will remain a net importer of soybean oilcake despite the increase in local production.

4 296 tons of soybeans/products have been exported so far this season compared to the 576 tons in the previous season. Globally, soybean exports during the 2014/2015 season amounted to 125.88 million metric tons with the United States and Argentina each exporting approximately 40% of this figure. Argentina was the third largest exporter of soybeans (8% of the total). The projected world soybean exports for the 2015/2016 currently stands at 129.85 million metric tons. China remains the largest importer of soybeans followed by the European Union and Japan. Argentina and Brazil are the largest exporters of soybean meal as well as soybean oil (*WASDE*).

RSA Production Regions

The RSA is divided into 9 provinces as illustrated in Figure 1.

Figure 1: RSA Provinces

Provincial map with gratitude to SIQ.

The 9 provinces are divided into 36 grain production regions.

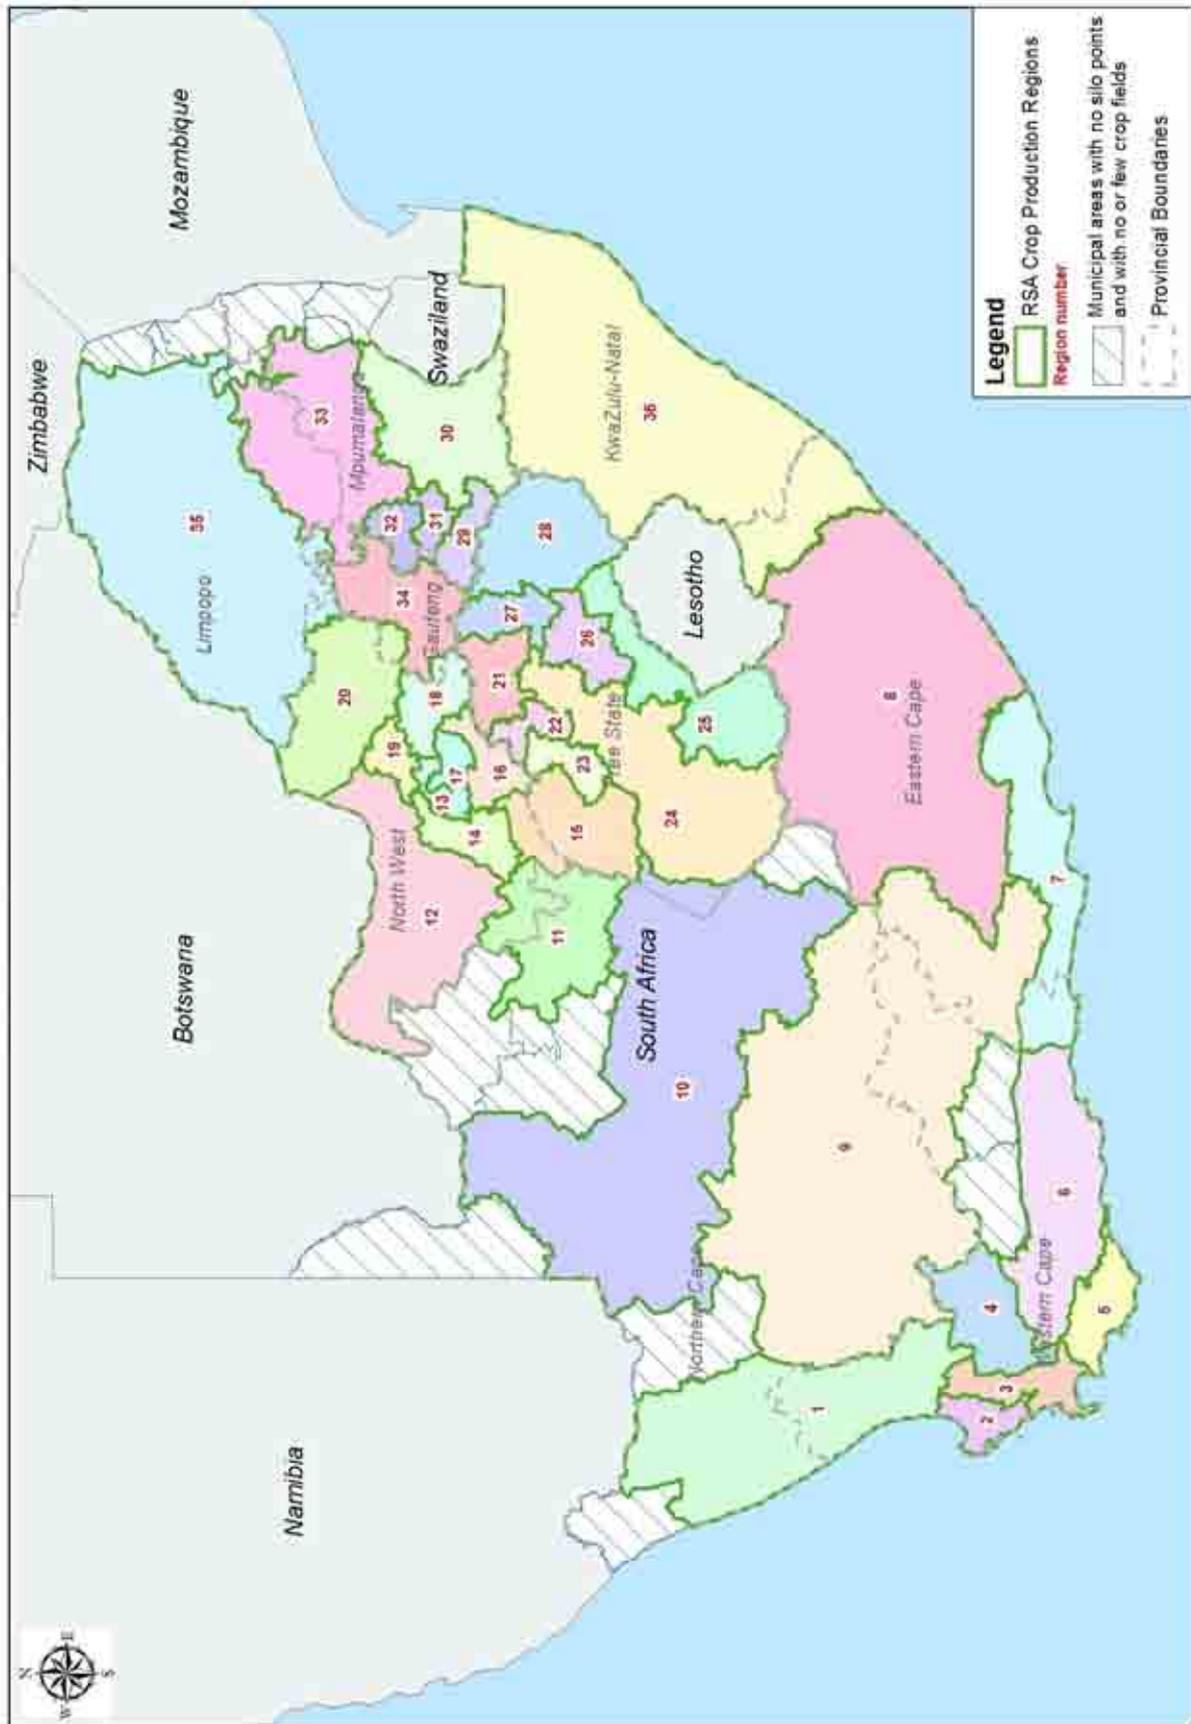

The regions are distributed as follows:

- Region 1: Namakwaland
- Regions 2 and 3: Swartland
- Regions 4 to 6: Rùens
- Regions 7 and 8: Eastern Cape
- Region 9: Karoo
- Region 10: Griqualand West
- Region 11: Vaalharts
- Regions 12 to 20: North West
- Regions 21 to 28: Free State
- Regions 29 to 33: Mpumalanga
- Region 34: Gauteng
- Region 35: Limpopo
- Region 36: KwaZulu-Natal

Please see the Crop Production Regions map on the next page.

The production regions from which soybeans have been received for the crop quality survey of the 2014/2015 production season, are named and described on pages 17 to 24 (in the header of the quality data per region tables.) The silo/intake stands as well as the type of storage structure per region are provided.

Figure 2: RSA Crop Production Regions

Regional map with gratitude to Agbiz Grain and SiQ.

Soybean Crop Quality 2014/2015 – Summary of results

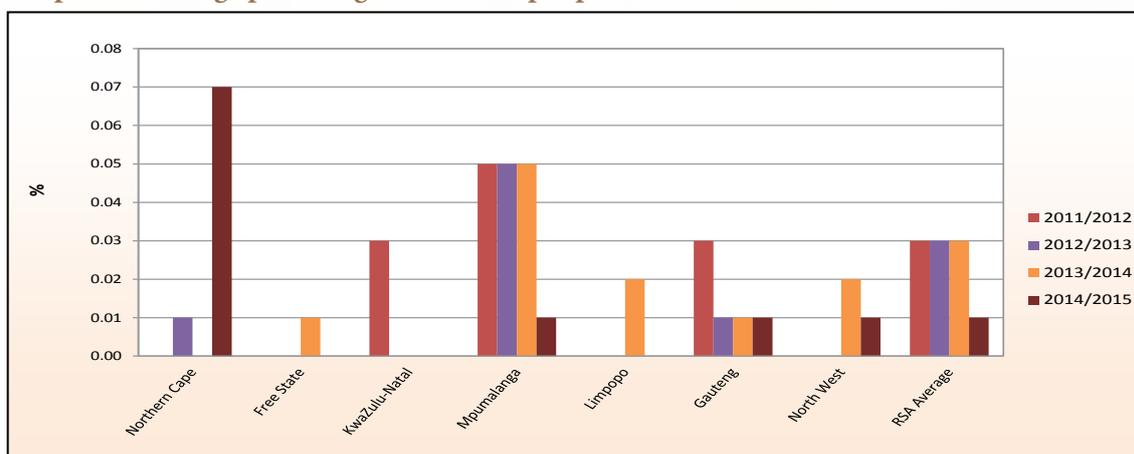

Eighty-seven percent (131) of the 150 samples analysed for the purpose of this survey were graded as Grade SB1 and 19 of the samples were downgraded to COSB (Class Other Soya Beans). During the previous two seasons, 12% (2013/2014) and 5% (2012/2013) of the samples were downgraded to COSB.

- One of the 19 samples was downgraded as a result of the percentage foreign matter, including stones, other grain and sunflower seed present in the sample exceeding the maximum permissible deviation of 5%.
- Five samples were downgraded as a result of the percentage other grain present in the samples exceeding the maximum permissible deviation of 0.5%.
- Two samples were downgraded as a result of the percentage sunflower seed present in the samples exceeding the maximum permissible deviation of 0.1%.
- One sample was downgraded as a result of the percentage soiled soybeans in the sample exceeding the maximum permissible deviation of 10%.
- Six of the samples were downgraded as a result of the presence of poisonous seeds (*Datura sp.*) exceeding the maximum permissible number, namely 1 per 1000 g.
- One sample was downgraded as a result of the presence of poisonous seeds (*Ipomoea purpurea Roth.*) exceeding the maximum permissible number, namely 7 per 1000 g.
- One sample was downgraded for exceeding both maximum permissible number of poisonous seeds (*Datura sp.* and *Ipomoea purpurea Roth.*).
- The remaining two samples were downgraded as a result of a combination of one or more of the following deviations exceeding the maximum permissible deviation: percentage other grain, defective soybeans and parts of soybeans above the 1.8 mm slotted sieve which pass through the 4.75 mm round hole sieve as well as poisonous seeds.

According to the South African soybean grading regulations, the determination of the percentage wet pods in a consignment shall be done on a working sample of at least 10 kg of soybeans from a representative sample of the consignment. Due to practical considerations the samples received at the SAGL from the grain storage companies is typically ± 5 kg. Pods were found in 22 of the 150 samples graded, all of these pods were dry on receipt at the SAGL. The percentage of these pods in the samples ranged from 0.14% to 0.63% based on a working sample size of at least 200 g. Eleven samples contained pods, not identifiable as wet pods according to the definition, in percentages exceeding the wet pod maximum permissible deviation of 0.2%.

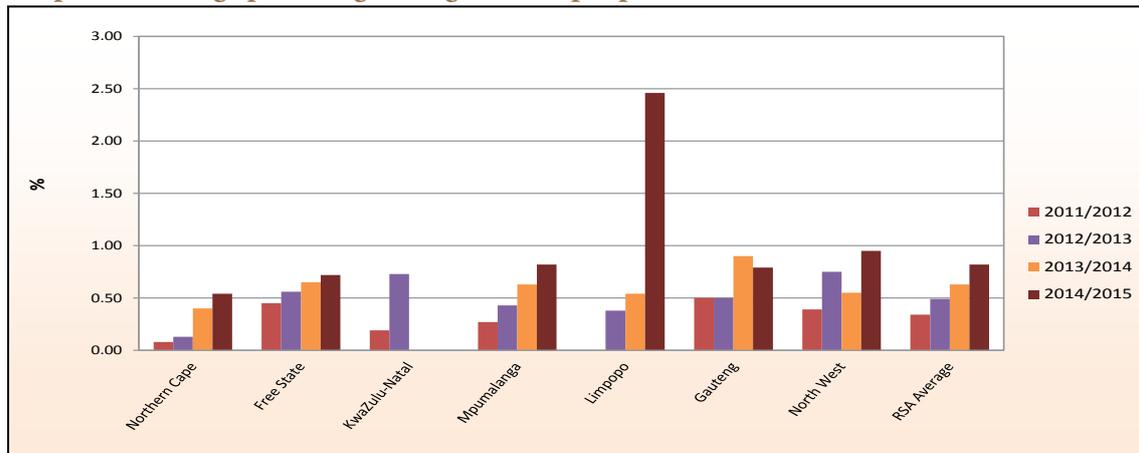

Based on the samples received for this crop survey, Sclerotinia did not pose any problems. The highest percentage of Sclerotinia observed (0.20%) was on a sample from Mpumalanga, which is well below the maximum permissible level of 4%. During this season, the samples from the Northern Cape had the highest weighted average percentage Sclerotinia (0.07%). The national weighted average percentage this season was 0.01% compared to the 0.03% of the previous three seasons. See Graph 16.

Graph 16: Average percentage Sclerotinia per province over four seasons

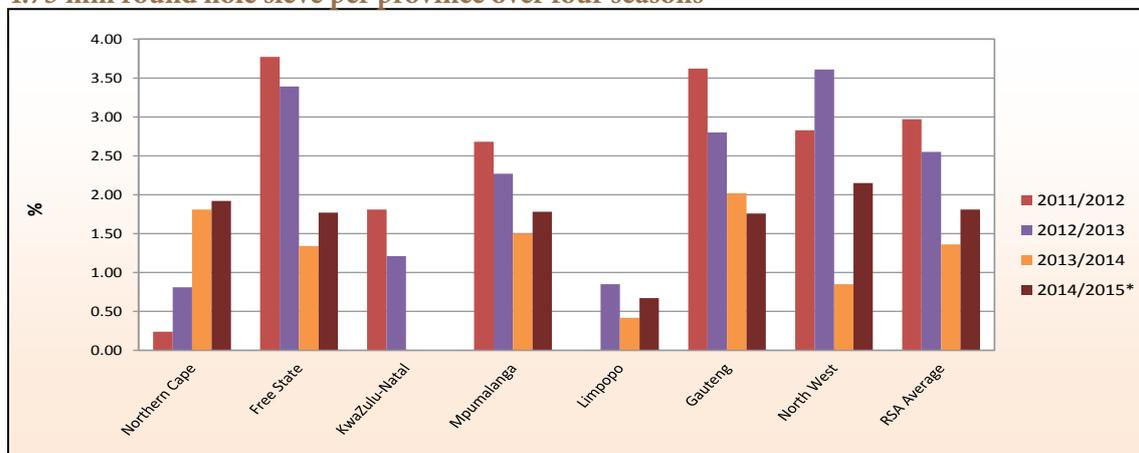

Limpopo province's two samples had the highest average percentage foreign matter. The weighted average percentage foreign matter in the rest of the samples ranged from 0.54 in the Northern Cape to 0.95 in North West province. Please refer to Graph 17.

Graph 17: Average percentage foreign matter per province over four seasons

North West province (18 samples) reported the highest weighted average percentage soybeans and parts of soybeans above the 1.8 mm slotted sieve which pass through the 4.75 mm round hole sieve, namely 2.15% and Limpopo (2 samples) the lowest at 0.67%. Mpumalanga province with the highest number of samples (77) reported an average of 1.78%. The Free State province averaged 1.77% (42 samples). The national weighted average percentage increased from 1.36% last season to 1.81% this season. Please see Graph 18. No samples were received from KwaZulu-Natal for the 2014/2015 season.

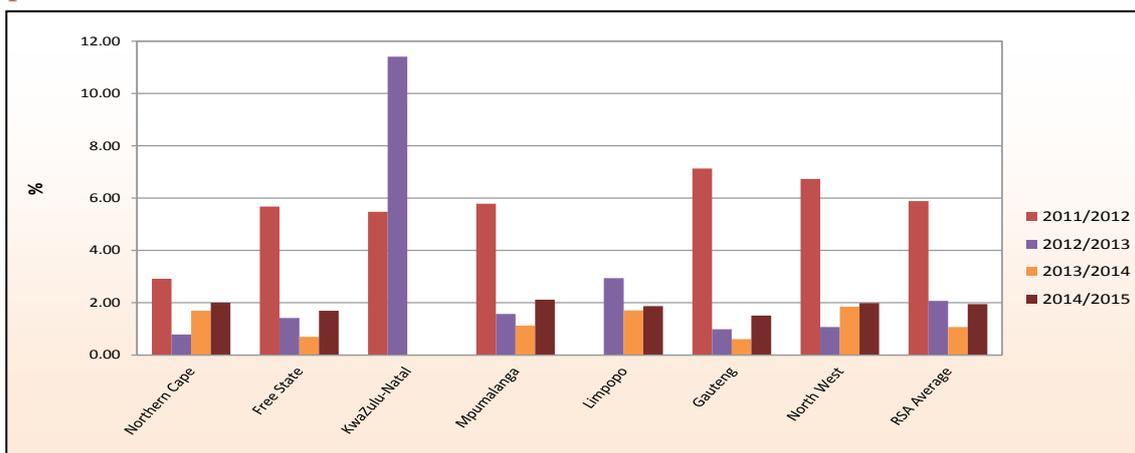

Graph 18: Average percentage soybeans and parts of soybeans which pass through the 4.75 mm round hole sieve per province over four seasons

*Please note that the 2014/2015 results represent soybeans and parts of soybeans above the 1.8 mm slotted sieve which pass through the 4.75 mm round hole sieve.

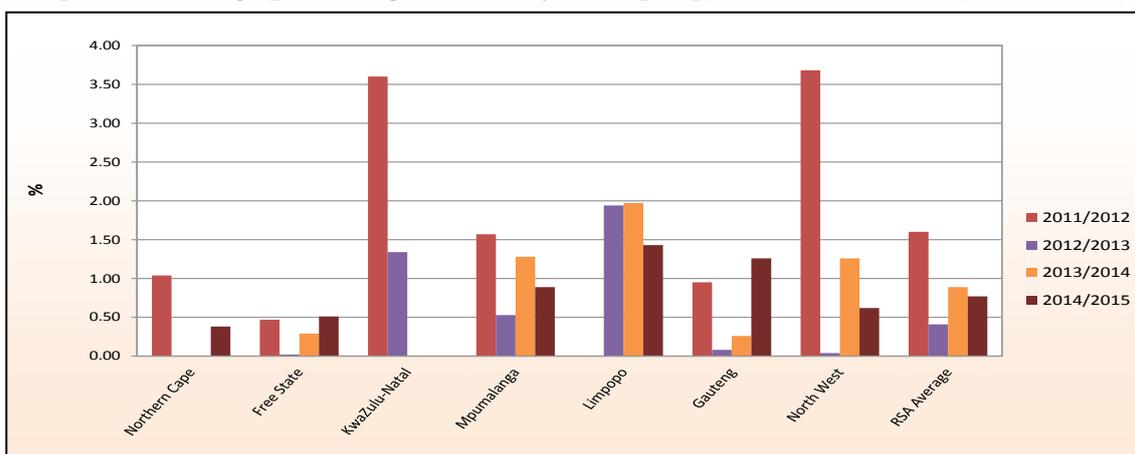

Eight samples were submitted from Gauteng province and the lowest weighted average percentage defective soybeans on the 4.75 mm sieve were reported on these, namely 1.51%. Mpumalanga province reported the highest percentage of 2.12, followed by the Northern Cape and North West provinces with 2.00 and 1.99 respectively. The national weighted average increased from 1.07% in the previous season to 1.95% this season. Please see Graph 19.

Graph 19: Average percentage defective soybeans on the 4.75 mm round hole sieve per province over four seasons

The RSA weighted average percentage soiled soybeans of 0.77% is lower than the 0.89% of the previous season but higher than the weighted average (0.41%) of the 2012/2013 season. Average weighted percentages per province ranged from 0.38 in the Northern Cape to 1.43 in Limpopo. Please see Graph 20. This season one sample from Mpumalanga had a soiled soybean percentage exceeding the maximum permissible deviation of 10%, none above the limit were observed during the 2013/2014 season.

Graph 20: Average percentage soiled soybeans per province over four seasons

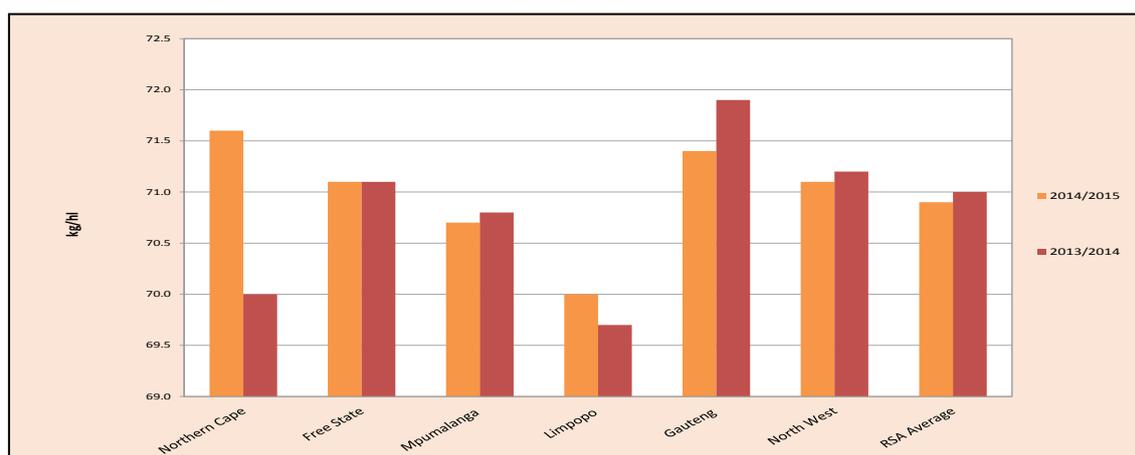

Test weight does not form part of the grading regulations for soybeans in South Africa. An approximation of the test weight of South African soybeans is provided in Table 2 for information purposes. The g/1 L filling weight of the 150 soybeans samples was determined by means of the Kern 222 apparatus. The test weight was extrapolated by means of the following formulas obtained from the Test Weight Conversion Chart for Soybean of the Canadian Grain Commission: $y = 0.1898x + 2.2988$ (291 to 350 g/0.5 L) and $y = 0.1895x + 2.3964$ (351 to 410 g/0.5 L). Please see also Graph 21 for a comparison of the test weight per province over the last two seasons.

Province	Test weight, kg/hl					
	2014/2015 Season			2013/2014 Season		
	Weighted average	Range	No. of samples	Weighted average	Range	No. of samples
Northern Cape (Regions 10 - 11)	71.6	71.2 - 71.9	3	70.0	69.8 - 70.2	2
Free State (Regions 21 - 28)	71.1	67.0 - 72.7	42	71.1	66.6 - 73.6	51
Mpumalanga (Regions 29 - 33)	70.7	63.3 - 78.2	77	70.8	68.3 - 74.7	66*
Limpopo (Region 35)	70.0	69.3 - 70.8	2	69.7	68.5 - 70.5	3
Gauteng (Region 34)	71.4	69.5 - 72.4	8	71.9	71.5 - 73.1	7
North West (Region 12 - 20)	71.1	68.8 - 72.2	18	71.2	69.4 - 73.1	20
RSA Average	70.9	63.3 - 78.2	150	71.0	66.6 - 74.7	149

* One sample with an outlier value was not taken into account for calculation purposes.

Graph 21: Comparison of the test weight per province over two seasons

The nutritional component analyses, namely crude protein, - fat, - fibre and ash are reported on a dry/moisture-free basis (db) for the current as well as the three previous surveys. For comparison purposes the national 'as is' basis results are provided in Table 3. These 'as is' values were calculated using the weighted national average values.

Table 3: Comparison of weighted average nutritional component values on a dry and 'as is' basis over four seasons

Season	2014/2015		2013/2014		2012/2013		2011/2012	
Moisture, % (17hr, 103°C)	7.0		7.1		7.2		6.8	
Moisture basis	Dry basis	As is						
Crude protein, %	39.89	37.10	39.84	37.01	40.63	37.70	39.42	36.74
Crude fat, %	19.3	17.9	19.7	18.3	18.8	17.4	18.7	17.4
Ash, %	4.64	4.32	4.66	4.33	4.65	4.32	4.62	4.31
Crude fibre, %	6.4	6.0	6.1	5.7	-	-	-	-
No. of samples	150		150		150		100	

The weighted average crude protein content this season was 39.89%, comparing very well with the 39.84% of the previous season. Mpumalanga showed the highest weighted average crude protein content of 40.44% and Limpopo the lowest of 36.16%. The weighted average crude fat percentage decreased from 19.7% in 2013/2014, to 19.3% this season. The samples from Limpopo had the highest weighted average crude fat content of 23.6%. The lowest average fat content was observed in Gauteng with 18.9%.

The national weighted average ash content did not vary significantly over the four seasons that this survey has been conducted, 4.64% this season compared to the 4.66% 4.65% and 4.62% for the previous three seasons. Samples from the Northern Cape and Limpopo tend to show higher ash contents over seasons. The weighted average percentage crude fibre varied from 4.9% in Limpopo to 7.5% in the Northern Cape. The RSA weighted average was slightly higher this season (6.4%), compared to 6.1% the previous season.

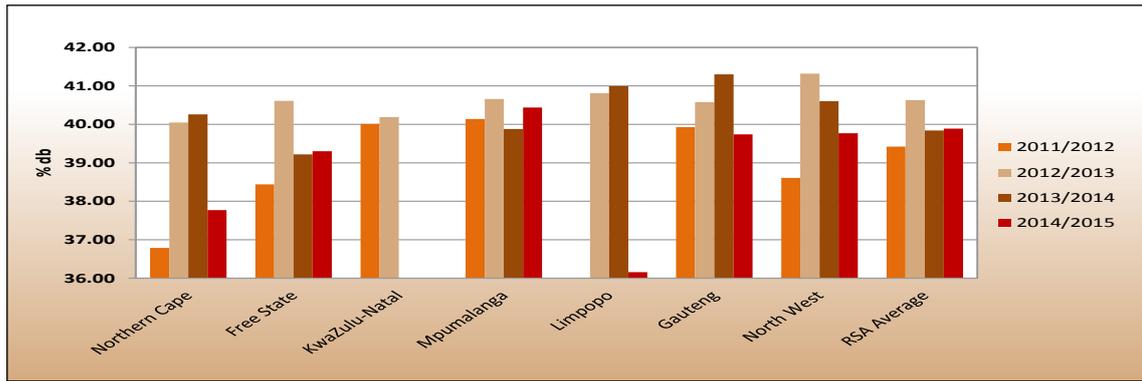

Graphs 22 to 25 on page 14 provide comparisons between provinces for the above mentioned components.

A summary of the RSA Soybean Crop Quality averages of the 2014/2015 season compared to those of the 2013/2014 season, is provided in Table 4 on page 15.

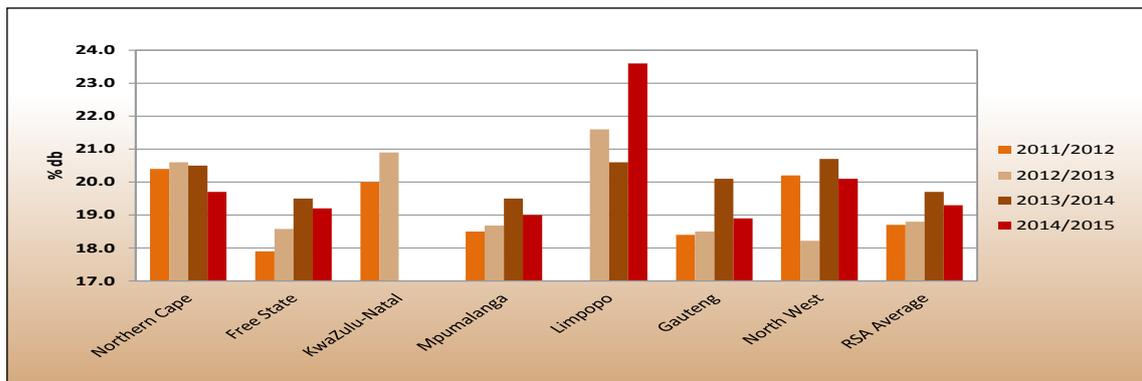

All fifteen samples tested for genetic modification (GM), tested positive for the presence of the CP4 EPSPS trait (Roundup Ready®). Please refer to the results in Table 5 on page 16 of this report.

Please see pages 17 to 24 for the average soybean quality per region.

*As per Dispensation REF NO 20.4.14.1 of 06 March 2015, the 1.8 mm slotted sieve is used in conjunction with the prescribed 4.75 mm round hole sieve.

Genetic Modification (GM)

The majority of soybeans produced/grown in South Africa is genetically modified, an estimated 92% of the area planted to soybeans in SA was GM. These soybeans have tolerance to herbicides (chemical products used to destroy weeds, but not the crop plants).

The SAGL screened 15 of the crop samples to test for the presence of CP4 EPSPS (Roundup Ready).

The crop quality samples received by the SAGL are composite samples per class and grade, made up of individual deliveries to grain silos.

SAGL used the EnviroLogix QuickComb kit for bulk soybeans to quantitatively determine the presence of genetically modified soybeans.

All of the samples tested positive for the presence of CP4 EPSPS.

GMO Protein/Trait	Event	Trade name/Brand
CP4 EPSPS	GTS40-3-2 MON89789	Roundup Ready®

The detection range for the CP4 EPSPS trait is 0.125% to 3%. The limit of quantification (LOQ) is therefore 0.125% and values higher than 3% is reported as >3.0%.

The Coefficient of Variation for this analysis is 20%.

METHODS

SAMPLING PROCEDURE:

A working group determined the procedure to be followed to ensure that the crop quality samples sent to the SAGL by the various grain silo owners, were representative of the total crop.

Each delivery was sampled as per the grading regulations for grading purposes.

After grading, the grading samples were placed in separate containers according to class and grade.

After 80% of the expected harvest had been received, the content of each container was divided with a multi slot divider in order to obtain a 3 kg sample. (This was done for each class and grade separately).

If there were more than one container per class and grade, the combined contents of the containers were mixed thoroughly before dividing it with a multi slot divider to obtain the required 3 kg sample.

The samples were marked clearly with the name of the depot, the bin/bag/bunker number(s) represented by each individual sample as well as the class and grade and were then forwarded to the SAGL.

GRADING:

Full grading was done in accordance with the Regulations relating to the Grading, Packing and Marking of Soybeans intended for sale in the Republic of South Africa (No. R 478 of 20 June 2014) as well as Industry-wide dispensations REF NO 20.4.14.1 dated 06 March 2015 and 12 March 2015 regarding the use of the 1.8 mm slotted sieve and the 4.75 mm round hole sieve during the grading of soybeans.

Please see pages 75 to 84 of this report.

TEST WEIGHT:

Test weight provides a measure of the bulk density of grain and oilseeds.

Test weight does not form part of the grading regulations for soybeans in South Africa. An approximation of the test weight of South African soybeans is provided in this report for information purposes. The g/1 L filling weight of the soybean samples was determined by means of the Kern 222 apparatus. The standard working procedure was followed. The test weight was extrapolated by means of the following formulas obtained from the Test Weight Conversion Chart for Soybean of the Canadian Grain Commission: $y = 0.1898x + 2.2988$ (291 to 350 g/0.5 L) and $y = 0.1895x + 2.3964$ (351 to 410 g/0.5 L).

CHEMICAL ANALYSIS:

Milling

Prior to the chemical analyses, the soybean samples were milled on a Retch ZM 200 mill fitted with a 1.0 mm screen.

Moisture

The method prescribed under the ISTA International Rules for Seed Testing, Section 9, latest edition was used to determine the moisture content of the soya samples. This method determines moisture content as a loss in weight of a sample when dried in an oven at 103 °C for 17 hours.

Crude protein

The Dumas combustion analysis technique was used to determine the crude protein content, according to AACCI method 46-30.01, latest edition.

This method prescribes a generic combustion method for the determination of crude protein. Combustion at high temperature in pure oxygen sets nitrogen free, which is measured by thermal conductivity detection. The total nitrogen content of the sample is determined and converted to equivalent protein by multiplication with a factor of 6.25 to obtain the crude protein content.

Crude fat

In-House method 024 was used for the determination of the crude fat in the samples. After sample preparation the fat is extracted by petroleum ether with the aid of the Soxhlet extraction apparatus, followed by the removal of the solvent by evaporation and weighing the dried residue thus obtained. The residue is expressed as % crude fat.

Ash

Ash is defined as the quantity of mineral matter which remains as incombustible residue of the tested substance, after application of the described working method. In-house method No. 011, based on AACCI method 08-02.01 Rapid (Magnesium Acetate) method, was used for the determination. The samples were incinerated at 700 ± 10 °C in a muffle furnace for 45 minutes.

Crude fibre

In-House method 020 was used for the determination of the crude fibre in the samples. Crude fibre is the loss on ignition of the dried residue remaining after digestion of the sample with 1.25% Sulphuric acid (H_2SO_4) and 1.25% Sodium hydroxide (NaOH) solutions under specific conditions.

GMO (Genetically Modified Organisms):

The EnviroLogix QuickComb kit for bulk soybeans was used to quantitatively determine the presence of genetically modified soybeans. The kit is designed to extract and detect the presence of certain proteins at the levels typically expressed in genetically modified bulk soybeans. The procedure prescribed in the EnviroLogix – QuickScan Instruction Manual, latest edition was followed. Results were scanned and interpreted quantitatively with the EnviroLogix QuickScan system.

CERTIFICATE OF ACCREDITATION

In terms of section 22(2) (b) of the Accreditation for Conformity Assessment, Calibration and Good Laboratory Practice Act, 2006 (Act 19 of 2006), read with sections 23(1), (2) and (3) of the said Act, I hereby certify that:-

SOUTHERN AFRICAN GRAIN LABORATORY NPC
Co. Reg. No.: 1997/018518/08

Facility Accreditation Number: T0116

is a South African National Accreditation System accredited Testing laboratory
provided that all SANAS conditions and requirements are complied with

This certificate is valid as per the scope as stated in the accompanying schedule of accreditation
Annexure "A", bearing the above accreditation number for

CHEMICAL AND PHYSICAL ANALYSIS

The facility is accredited in accordance with the recognised International Standard

ISO/IEC 17025:2005

The accreditation demonstrates technical competency for a defined scope and the operation of a
laboratory quality management system

While this certificate remains valid, the Accredited Facility named above is authorised to use the
relevant SANAS accreditation symbol to issue facility reports and/or certificates

Mr R Josias

Chief Executive Officer

Effective Date: 01 November 2014

Certificate Expires: 31 October 2019

BEDANKINGS

Dank is verskuldig aan die volgende persone vir hul onderskeie bydraes in die verwesenliking van hierdie verslag:

- 1 Alle medewerkers en koöperateurs soos gelys op bladsy 11.**
- 2 Mev. H. Vermeulen vir rekenarisering van data en saamstel van die verslag.**
- 3 Mnr Frikkie Calitz, Me Nicolene Thiebaut, Dr André Nel vir hul hulp met die verwerking en interpertering van die data.**
- 4 Die Navorsings Bestuurder, IGG; en sojabooncultivarevaluasiekomitee, onder wie se wakende oog die proewe uitgevoer is.**
- 5 Kollegas (me L. Bronkhorst, mnre N. Mogapi, C. Ramatlotlo en S. Seutwadi) en personeel van IGG wie op direkte of indirekte wyse bystand verleen het.**
- 6 Die saadmaatskappye (Tabel 1). Proteïennavorsingstigting (PNS) en Landbounavorsingsraad (LNR) wie die projek finansieer.**

ACKNOWLEDGEMENTS

Credit is due to the following persons for their respective contributions to this report:

- 1 All the collaborators and co-operators as listed on page 11.**
- 2 Mrs. H. Vermeulen for processing of data and for compiling the report.**
- 3 Mr Frikkie Calitz, Me Nicolene Thiebaut, Dr André Nel for the processing and interpretation of the data.**
- 4 The Research Manager (GCI), and the soybean cultivar evaluation committee under whose watchful eye the trials were executed.**
- 5 Colleagues (me L. Bronkhorst, mr's N. Mogapi, C Ramatlotlo and S. Seutwadi) and personnel of GCI who rendered assistance in a direct or indirect way.**
- 6 The Seed Companies (Table 1), Protein Research Foundation (PRF) and Agricultural Research Council (ARC) for financing the project.**

1 INTRODUCTION

The National Soybean Cultivar Trials (project M101/62) were planted for the 37th successive year this past growing season. A total of 22 trials were planted at 20 localities, illustrated in the locality list.

1.1 AIM

The aim of the project was primarily the following:

- (i) To compare cultivars for agronomic and economic performance;
- (ii) to test the adaptability of cultivars and new releases for specific areas and cultivation practices.

2 MATERIALS AND METHODS

2.1 GENERAL

The trials were planted as randomized block designs (Rows & columns) using three replications with 30 cultivars. Cultivar characteristics are shown in Table 1.

Each trial plot consisted of four, 5 m rows. Four metres were harvested from each of the middle two rows, in order to avoid border effects. Soil form, fertilization and weed control are indicated together with row spacing in Table 2. All seeds were inoculated with Bradyrhizobium japonicum bacteria at planting.

The localities where trials were planted represent a wide range of climatic conditions. Trials were carried out on the ARC and Departmental Research Stations as well as on privately owned farms. Observations were recorded by responsible officers and collaborators as indicated in the list of collaborators. Planting time and cultivation practice were executed to correspond with that of commercial plantings in the specific areas. Rainfall and irrigation are indicated in Table 3. Note that rainfall is only recorded from October to April and not for the specific growing season of a trial.

2.2 OBSERVATIONS

A brief definition of some of the observations in the trials is as follow:

- 2.2.1 Date of flowering: The time at which one fully open flower per plant was observed across 50% of the plots.
- 2.2.2 Date of harvest maturity: When 95% of the pods for a given plot had turned brown.
- 2.2.3 Length of growing season: The number of days from date of planting to date of maturity.
- 2.2.4 Plant height: The average height in centimeter (cm) of plants from the soil surface to the growth point at maturity.
- 2.2.5 Pod height: The average height in centimeter (cm) of the lowest pods on the plant from soil surface at maturity.
- 2.2.6 Green stem: The percentage green stems at harvest rated on a 1 (normally mature) to 5 (more than 80% green stems) scale.
- 2.2.7 Lodging: Lodging at time of harvest was rated on the following scale:
- 1 = No lodging
 - 2 = Few lodging, will not hamper mechanical harvesting
 - 3 = Few lodging, lodging less than what will hamper mechanical harvesting
 - 4 = Few lodging, will hamper mechanical harvesting, with yield loss
 - 5 = Fair number of plants lodged, will hamper mechanical harvesting, with yield loss
 - 6 = Many plants lodged, will hamper mechanical harvesting, with yield loss

- 7 = A large number of plants lodged, will hamper mechanical harvesting, with yield loss
- 8 = Nearly all plants lodged, will hamper mechanical harvesting, yield loss
- 9 = All plants lodged, will hamper mechanical harvesting, yield loss

2.2.8 Shattering: Measured at time of harvest and three weeks later. Shattering is reported on a scale of 1 (no shattering) to 5 (more than 91-100% pods shattered).

2.2.9 100 seeds mass: Determined on an air dry basis from a randomly selected sample retained on a 4,75 mm standard grading screen.

2.2.10 Undesirable seed: The mass of undesirable seed was determined in a random 100 g sample with seed size greater than 4,75 mm (excluding mechanical damaged seeds).

2.2.11 Protein and oil percentage: The determinations were done on a sample with whole seeds (moisture free) and a variation can be expected.

2.2.12 Seed yield: Four metres of the two centre rows were harvested by hand at soil level and threshed. Seed moisture was determined and seed yield calculated on a basis of 12,5% moisture content.

2.3 THE EVALUATION OF TRIALS

The yield data of the individual trials were subjected to analysis of variance (ANOVA) with a randomized complete block design used. From the components of variance the following parameters were calculated, viz: C_e , (error coefficient of variation); C_g , (genetic coefficient of variation); t , (repeatability of plot yield or intra class correlation coefficient) and t_n , (repeatability of mean yield).

The diagnostic value of these parameters may be illustrated as follows:

The t parameter as defined above relates to the repeatability of plot means over replications, and is interpreted in the same way as the normal correlation coefficient, i.e. the greater the concurrence of plot values per entry over replications the closer t will strive towards unity. The standard error $SE(t)$ calculated for a particular t -value indicates the accuracy for the estimate of t .

The t_n parameter relates to the repeatability of entry cultivar means, and can be defined as the relationship of genetic variance (the variance of true yield of entries) to the total variance of observed means. In cultivar trials this parameter is useful only when the number of replications between trials varies, where this is not the case, the t -value is sufficient.

The localities with coefficient of variance higher than 25% were rejected from the analysis.

The trial means versus the cultivar means is plotted. A regression line is then fitted with the trial means as x variable and cultivar means as predictor variable. Out of the regression estimates the yield probability percentage above the mean for each cultivar at different yield potentials is then calculated and presented in a table as a guideline for the use of different cultivars under different circumstances.

3 DISCUSSION OF RESULTS

3.1 GENERAL

The rainfall and irrigation data are shown in Table 3. Sporadic early rains limited the ideal planting period. Most of the soybean production areas also experienced sporadic hail storms resulted in the replanting of four (4) trials. Drought during the pod filling stage also contributed to below average yield.

A total of four (4) of the 22 trials (18%) could not be included in the report compared to the five (5) out of 21 trials (23.8%) in the 2013/14 season.

The following trials could not be included in the report for the following reasons:

- 1 Hoopstad – High CV due to hail during harvesting.
- 2 Greytown – Destroyed by a hail storm.
- 3 Koedoeskop – Low yield due to a low plant count caused by malfunctional planter.
- 4 Stoffberg – First and replanting destroyed by hail.

As in the previous seasons the evaluation of the trials was based on a number of parameters. No conclusion can be made on a single parameter.

3.2 DISCUSSION OF TABLES

3.2.1 Days to flowering (Table 4), physiologically mature (Table 5) and length of the growing season (Table 6)

The number of days from planting to flowering (Table 4) is an effective measure for the grouping of cultivars because the relative order of rank for this characteristic is repeated to a great extent over localities and years. As expected the average days to flowering was the shortest in the warm areas (40 days at Atlanta and 46 in Brits) and the longest in the cooler areas (82 days at Kokstad).

The number of days to physiological maturity is shown in Table 5. The longest average days to maturity was experienced at Delmas (157 days).

The number of days to harvest maturity (Table 6) was used to determine the length of the growing season of a cultivar. The number of days to harvest maturity is however, more dependent on climatic changes and planting date for soybeans and, the number of days to flowering is therefore a more reliable maturity grouping criterion.

3.2.2 Plant height (Table 7)

The indeterminate cultivar DM 6.8i RR (MG 6.8) showed a mean plant height of 106 cm (highest) in the cool area compared to 57 cm (lowest) of the semi-determinate cultivar LS 6444 R (MG 4) in the moderate region and LS 6261 R (MG 6.0) in the

warm area. Plant height for cultivars with an indeterminate growth habit was in general higher than those with a determinate growth habit.

The average plant height between localities varied from a mean of 48 cm at Migdol to 101 cm at Delmas.

3.2.3 Pod height (Table 8)

The variation in pod and plant height between cultivars is linked with the length of the growing season of a cultivar. The determinate cultivars PHB 95 Y 20 R (MG 5.2) and LS 6466 R (MG 6.0) and PAN 1614 R (MG 6.2) an indeterminate cultivar showed a mean pod height of 13 cm in the moderate area, while PAN 6164 R (MG 6.0) also had an average pod height of 13 cm in the cool areas.

LS 6444 R (MG 4) (semi-determinate) who as for the third (3) season had the lowest reading of 6 in the cool, moderate and warm regions. Considerable harvest losses can occur due to low pod height; thus pod height is an important factor influencing cultivar choice. Differences in pod height between localities can mainly be attributed to differences in row width and climate. The fact that the trials are being harvested by hand, it might favour the yield figures, and may be worth while looking at the yield percentage above the 7.5 cm combine harvesting height.

3.2.4 Lodging (Table 9)

The highest lodging occurred in the trial for the second (2) consecutive year at Delmas. The highest lodging figures was reported for PAN 1623 R, DM 6.2i RR, LS 6164 R and DM 6.8i RR in the cool and moderate production areas with the highest number of 5.

3.2.5 Green stem (Table 10)

A lot of green stem was reported for the third consecutive year at Groblersdal. The cultivar NS 5909 R, showed a high tendency for green stem, across all three climatic regions. Plants also retained their leaves that could hamper the harvesting process.

3.2.6 Shattering 3 weeks after harvesting (Table 11)

The highest shattering occurred on the Potchefstroom Irrigation and Potchefstroom PD1 Dryland trials in the moderate production area. Limited shattering were recorded at Middelburg, Brits and Kinross.

3.2.7 Number of plants (Table 12)

Enough certified seed was provided to establish 400 000 plants ha⁻¹ for the irrigation and high rainfall areas and 350 000 for dryland. The low plant numbers at Groblersdal were due to pigeon damage and very high temperatures just after planting.

3.2.8 Percentage undesirable seed (Table 13)

The lowest mean of 0.58% undesirable seeds was recorded for the cool region. The range varied from 1.35% at Brits to 0.10% at Cedara.

3.2.9 Mass (g) 100⁻¹ seeds (Table 14)

The variation in seed mass among localities ranged between 12.97 g 100⁻¹ seeds at Dundee to 19.06 g 100⁻¹ seeds at Groblersdal. The highest seed mass was recorded for PAN 6240 R across all climatic regions, while LS 6444 R as last season had the smallest seed for the most part across all areas.

3.2.10 Oil percentage (Table 15)

LS 6146 R had, like the three previous seasons, the highest average oil percentage for all the regions (21.63% cool, 21.66% moderate, 23.54% warm) The lowest oil percentage was recorded for PHB 95 Y 20 R for the cool (18.13%) and moderate (20.18%) areas.

3.2.11 Crude Protein percentage (Table 16)

The crude protein is negatively correlated to the oil percentage thus LS 6444 R had

had for the past two seasons the lowest crude protein for all regions (36.87% cool, 36.85% moderate and 38.37% warm). PHB 95 Y 20 R had the highest figure for the cool area (40.13%) and (38.29%) for the moderate area.

3.2.12 Profat (Table 17)

The inclusion of this table in the report was requested by Dr Erhard Bredendam as the total value of oil and protein is a much better indicator for the selection of a cultivar than the single oil or protein factor. PHB 94 Y 80 R had the highest average profat value for all the regions. PHB 95 Y 20 R 00 had a percentage above 64% in the warm regions.

3.2.13 Yield (Table 18)

Due to the sensitivity of soybean cultivars to environmental conditions, it is preferable to divide the soybean production areas into cool, moderate and warm regions. A better yield can be established by choosing a cultivar suitably adapted for a specific region. It is also necessary to use data from more than one year to select between cultivars. Due to the significant cultivar and locality interaction, conclusions on cultivar performance should not be made from average yield data alone. The mean yield over localities has therefore been omitted.

4 INTERPRETATION OF YIELD RESULTS

4.1 INTRODUCTION

A stated aim of the national soybean cultivar trials is the evaluation of cultivars for their adaptability to a potential production area, and for their yield performance. Adaptability is especially important because of the fact that soybean cultivars are known to be restricted in terms of recommended production area. This fact is also demonstrated by the results discussed in this report.

Because of genotypic restriction in adaptability the statistical analysis of data over all trial entries and localities tend to demonstrate strong interaction components which

confound interpretation. Interaction makes genotype rankings at one site inapplicable to another site. The larger the interaction the more information is lost if interaction is not analysed effectively. This will be a lesser problem for homogeneous areas than for non-homogeneous areas. However, a purpose of the national trials is to identify homogeneous areas or homogeneous growing conditions based on cultivar performance. Localities were therefore grouped together based on past research experience and with the assistance of photo thermal charts provided by the Institute for Soil, Climate and Water. Localities were grouped in cool, moderate and warm production areas.

4.2 YIELD PROBABILITY AND YIELD (Tables 19, 20, 21, 22, 23 & 24)

A minimum number of successful trials per climatic area are needed to calculate saved yield probability values. Yield probability tables are set up for cool-, moderate and warm regions, if enough data is available.

Yield probability of a cultivar is the chance to get an above average yield at a particular yield potential. For instance, if the yield probability of a cultivar, at a particular yield potential equals 60%, the chance to get a yield above the mean of all cultivars is 60% with a 40% chance of obtaining a yield below the mean.

PAN 1454 R and LS 6453 R showed an above average yield probability (Table 19) for the low to medium yield potential, (cool area), while LS 6248 R and PAN 1583 R had an above average yield probability in the medium to high yield potential range for the same climatic region. For the moderate area PAN 1583 R and LS 6161 R showed above average figures over the whole production potential range. LS 6161 R also performed above average for the warm areas.

AGRICULTURAL PRODUCT STANDARDS ACT, 1990
(ACT No. 119 OF 1990)

**REGULATIONS RELATING TO THE GRADING, PACKING AND MARKING OF SOYA BEANS
INTENDED FOR SALE IN THE REPUBLIC OF SOUTH AFRICA**

The Minister of Agriculture has under section 15 of the Agricultural Product Standards Act, 1990 (Act No. 119 of 1990) --

- (a) made the regulations in the Schedule;
- (b) determined that the said regulations shall come into operation on date of publication; and
- (c) read together with section 3(2) of the said Act, repealed the Regulations published by Government Notice No. R 1178 of 24 November 2000, and R 225 of 06 March 2009.

SCHEDULE

Definitions

1. In these regulations any word or expression to which a meaning has been assigned in the Act, shall have that meaning and, unless the context otherwise indicates --

"bag" means bag manufactured from --

- (a) jute or phormium or a mixture of jute and phormium; or
- (b) polypropylene that complies with SANS 1246: 2012;

"bulk container" means any vehicle or container in which bulk soya beans is transported or stored;

"consignment" means --

- (a) a quantity of soya beans of the same class, which belongs to the same owner, delivered at any one time under cover of the same consignment note, delivery note or receipt note, or delivered by the same vehicle or bulk container, or loaded from the same bulk storage structure or from a ship's hold; or
- (b) in the case where a quantity referred to in paragraph (a), is subdivided into different grades, each such quantity of each of the different grades;

"container" means a bag or a bulk container;

"defective soya beans" means soya beans and pieces of beans which --

- (a) have been damaged by frost, heat or weather conditions;
- (b) have been visibly damaged by insects;
- (c) are contaminated by moulds or infected by plant diseases;
- (d) have a distinctly immature form or which are covered with a whitish membrane or where the testa have a green discolouration; and

- (e) when the testa is removed, display discolouration, excluding green discolouration: Provided that soya beans which were damaged by insects in the green pod stage and of which the discolouration as a result of the damage is not larger than half of the surface of the soya beans, shall not be deemed as defective soya beans;

"foreign matter" means all matter other than soya beans, glass, coal, dung, or metal and loose seed coats of soya beans as well as pods;

"frost damaged" means soya beans with green to brown seed-lobes with a waxy appearance;

"heat damaged" means soya beans with light to dark brown seed-lobes in a cross section;

"insect" in relation to soya beans, means any live insect which is injurious to stored soya beans, irrespective of the stage of development of the insect;

"mould infected " means soya beans that are shrivelled and deformed in appearance with a colour that varies from medium to dark brown, whereby the parts of infected beans are covered in mould;

"other grains" kernels or pieces of kernels of wheat, barley, oats, triticale, maize, rye and sorghum;

"pods" all whole or damaged soya bean pods;

"poisonous seeds" mean seeds or part of seeds of plant species that in terms of the foodstuffs, cosmetics and disinfectants Act, 1972 (Act No. 64 of 1972), may represent a hazard to human or animal health when consumed, including seeds of *Argemone mexicana L*, *Convolvulus spp.*, *Crotalaria spp.*, *Datura spp.*, *Ipomoea spp.*, *Lolium temulentum*, *Ricinus communis* or *Xanthium spp.*;

"sclerotia" *Sclerotinia sclerotiorum* is a fungus that produces hard masses of fungal tissue known as sclerotia. The sclerotia vary in size and form and consist of a dark black exterior, a white interior and a rough surface texture;

"soiled soya beans" means whole soya beans which do not pass through the 4.75 mm sieve and which are discoloured by soil or any other substance: Provided that if the discolouration is caused by plant material such soya beans shall not be regarded as soiled soya beans;

"soya beans" means the threshed seed or a pieces of seeds of the plant *Glycine max* and where the word "soya beans" is used in conjunction with the word "consignment", it includes matter other than soya beans that is included in a consignment;

"the Act" means the Agricultural Product Standards Act, 1990 (Act No. 119 of 1990);

"the 4,75 mm round-hole sieve" means a sieve --

- (a) with a flat metal sheet of 1.0 mm thickness perforated with round holes of 4,75 mm in diameter that are arranged with the centres of holes at the points of intersection of an equilateral triangular grid with a pitch of 8 mm;
- (b) of which the upper surface of the sieve is smooth;
- (c) the frame of which is at least 40 mm high;
- (d) with the inner width of at least 200 mm and the inner length of at least 300 mm or, in the case of a circular sieve, the inner diameter of at least 278 mm; and
- (e) that fits onto a tray with a solid bottom; and not less than 20 mm above the bottom of the tray; and

"wet pods" all whole or damaged soya bean pods with a moisture content higher than the permissible

Restrictions on sale of soya beans

2. (1) No person shall sell soya beans in the Republic of South Africa --
- (a) unless the soya beans are sold according to the classes set out in regulation 3;
 - (b) unless the soya beans comply with the standards for the class concerned set out in regulation 4;
 - (c) unless the soya beans, where applicable, comply with the grades of soya beans and the standards for grades set out in regulation 5 and 6 respectively;
 - (d) unless the soya beans are packed in accordance with the packing requirements set out in regulation 7;
 - (e) unless the container or sale documents, as the case may be, are marked in accordance with the marking requirements set out in regulation 8; and
 - (f) if such soya beans contain a substance that renders it unfit for human or animal consumption or for processing into or utilisation thereof as food or feed.
- (2) The Executive Officer may grant written exemption, entirely or partially to any person on such conditions as he or she may deem necessary, from the provision of subregulation (1): Provided that such exemption is done in terms of section 3(1) (c) of the Act.

PART I

QUALITY STANDARDS

Classes of soya beans

3. There are two classes of soya beans, namely Class SB and Class Other soya beans.

Standards for classes of soya beans

4. (1) A consignment of soya beans shall --
- (a) be free from a musty, sour, khaki bush or other undesired odour;
 - (b) be free from any substance that renders it unsuitable for human or animal consumption or for processing into or utilisation as food or feed;
 - (c) contain not more poisonous seeds than permitted in terms of the Foodstuffs, Cosmetics and Disinfectants Act, 1972 (Act No. 54 of 1972);
 - (d) shall be free from stones, glass, metal, coal or dung;
 - (e) with the exception of Class Other soya beans, be free from insects;
 - (f) with the exception of Class Other soya beans, have a moisture content of not more than 13 percent; and
 - (g) shall not exceed the maximum percentage of permissible deviation as determined in the Table in the Annexure for the grade.

- (2) A consignment of soya beans is classified as Class SB if it --
 - (a) consists of any cultivar of soya beans; and
 - (b) complies with the standards for the grade of Class SB soya beans as set out in regulation 5.
- (3) A consignment of soya beans is classified as Class Other soya beans if it does not comply with the standards for Class SB.

Grades for soya beans

5. (1) Soya beans of Class SB shall be graded as Grade SB1; and
- (2) No grades are determined for Class Other soya beans.

Standards for grades of soya beans

6. A consignment of soya beans shall be graded as--

Grade SB1 soya beans if the nature of the deviation, specified in column 1 of Table 1 of the Annexure, in that consignment does not exceed the percentage specified in column 2 of the said table opposite the deviation concerned.

PART II

PACKING AND MARKING REQUIREMENTS

Packing requirements

7. Soya beans of different classes and grades shall be packed in different containers or stored separately.

Marking requirements

8. Each container or the accompanying sales documents of a consignment of soya beans shall be marked or endorsed with the class and grade of the soya beans.

PART III

SAMPLING

Obtaining sample

9. (1) A representative sample of a consignment of soya beans shall --
 - (a) in the case of soya beans delivered in bags and subject to regulation 10, be obtained by sampling at least ten percent of the bags, chosen from that consignment at random, with a bag probe: Provided that at least 25 bags in a consignment shall be sampled and where a consignment consists of less than 25 bags, all the bags in that consignment shall be sampled; and
 - (b) in the case of soya beans delivered in bulk and subject to regulation 10, be obtained by sampling that consignment throughout the whole depth of the layer, in at least six different places, chosen at random in that bulk quantity, with a bulk sampling apparatus.
- (2) The collective sample obtained in subregulation (1) (a) or (b) shall --

- (a) have a total mass of at least 10 kg; and
- (b) be thoroughly mixed by means of dividing before further examination.

(3) If it is suspected that the sample referred to in subregulation (1)(a) is not representative of that consignment, an additional five percent of the remaining bags, chosen from that consignment at random, shall be emptied into a suitable bulk container and sampled in the manner contemplated in subregulation (1)(b).

(4) If it is suspected that the sample referred to in subregulation (1) (b) is not representative of that consignment, an additional representative sample shall be obtained by using an alternative sampling pattern, apparatus or method.

(5) A sample taken in terms of these regulations shall be deemed to be representative of the consignment from which it was taken.

Sampling if contents differ

10. (1) If, after an examination of the soya beans taken from different bags in a consignment in terms of regulation 9(1), it appears that the contents of those bags differ substantially --

- (a) all the bags in the consignment concerned shall be sampled in order to do such separation;
- (b) the bags concerned shall be placed separately; and
- (c) each group of bags with a similar content in that consignment shall for the purpose of these regulations be deemed to be a separate consignment.

(2) If, after the discharge of a consignment of soya beans in bulk has commenced, it is suspected that the consignment could be of a class or grade other than that determined by means of the initial sampling, the discharge shall immediately be stopped and the part of the consignment remaining in the bulk container, as well as the soya beans already in the collecting tray, shall be sampled anew with a bulk sampling apparatus or by catching at least 20 samples at regular intervals throughout the whole off loading period with a suitable container from the stream of soya beans flowing in bulk.

Working sample

11. A working sample shall be obtained by dividing the representative sample of the consignment according to the ICC (International Association of Cereal Science and Technology) 101/1 method.

PART IV

INSPECTION METHODS

Determination of undesired odours, harmful substances, poisonous seeds, glass, metal, coal, dung and insects

12. A consignment or a sample of a consignment of soya beans shall be sensorially assessed or chemically analysed in order to determine --

- (a) whether it has musty, sour, khaki bush or other undesired odour;
- (b) whether it contains a substance that renders it unfit for human or animal consumption or for processing into or for utilisation as food or feed;
- (c) whether it contains poisonous seeds;
- (d) whether it contains glass, metal, coal or dung; and

- (e) whether it contains any insects.

Determination of moisture content

13. The moisture content of a consignment of soya beans may be determined according to any suitable method: Provided that the result thus obtained is in accordance with the maximum permissible deviation for a class 1 moisture meter as detailed in ISO 7700/2 based on result of the 72 hour, 103°C oven dried method [AACC ("American Association of Cereal Chemists") 44-15A].

Determination of percentage of wet pods

14. The percentage of wet pods in a consignment of soya beans shall be determined as follows:
- (a) Obtain a working sample of at least 10 kg of soya beans from a representative sample of the consignment.
 - (b) Remove all wet pods by hands from the working sample and determine the mass thereof.
 - (c) Express the mass thus determined as a percentage of the mass of the working sample concerned.
 - (d) Such percentage represents the percentage of wet pods in the consignment concerned.

Determination of percentage of other grain, sunflower seed, stones, sclerotia and foreign matter

15. The percentage of other grain, sunflower seed, stones, *sclerotia* and foreign matter in a consignment of soya beans shall be determined as follows:
- (a) Obtain a working sample of at least 200g soya beans from a representative sample of the consignment.
 - (b) Remove all other grain, sunflower seed, stones, sclerotia and foreign matter by hand from the working sample and determine the mass of the other grain, sunflower, seed, stone and foreign matter separately.
 - (c) Express each respective mass thus determined as a percentage of the mass of the working sample concerned.
 - (d) Such percentages represent the different percentages of other grain, sunflower seed, stones, sclerotia and foreign matter respectively in the consignment concerned.

Determination of the percentage defective soya beans

16. The percentage of defective soya beans in a consignment of soya beans shall be determined as follows:
- (a) Obtain a working sample of at least 100g soya beans, free of other grain, sunflower seed, stones, sclerotia and foreign matter, from the representative sample of the consignment.
 - (b) Sieve the working sample with the 4, 75 mm round-hole sieve by moving the sieve 20 strokes to and fro, alternately away from and towards the operator of the sieve for 20 seconds.
 - (c) Remove all defective soya beans from the other soya beans on the 4.75 mm round hole-sieve by hand.

- (d) Determine the mass of the defective soya beans on the 4, 75 mm round-hole sieve and express it as a percentage of the mass of the working sample concerned.
- (e) Such percentage represents the percentage of defective soya beans in the consignment.

Determination of the soya beans and pieces of beans which pass through the 4, 75 mm round hole sieve

17. The percentage of soya beans and pieces of soya beans which pass through the 4, 75 mm round hole sieve in a consignment of soya beans shall be determined as follows:

- (a) Determine the mass of the soya beans and pieces of soya beans in the tray as obtained according to regulation 16(a) and (b) and express it as a percentage of the mass of the working sample obtained in regulation 16(a).
- (b) Such percentage represents the percentage soya beans and pieces of soya beans in the consignment which passes through the 4, 75 mm round-hole sieve.

Determination of percentage of soiled beans

18. The percentage of soiled soya beans in a consignment of soya beans shall be determined as follows:

- (a) Remove all soiled soya beans from the working sample obtained in regulation 16(a) by hand and determine the mass thereof.
- (b) Express the mass thus determined, as a percentage of the mass of the working sample obtained in regulation 16(a).
- (c) Such percentage represents the percentage of soiled soya beans in the consignment concerned.

PART V

MASS DETERMINATION

19. The mass of soya beans shall be determined by deducting the actual percentage sclerotia, and foreign matter found during the inspection process from the total mass of the consignment: Provided that the weighing instruments used for the determination of mass shall comply with the requirements of SANS 1649:2001 published in terms of the Trade Metrology Act, 1973 (Act No. 77 of 1973) for the specific class of instrument.

PART VI

OFFENCES AND PENALTIES

20. Any person who fails to comply with any provision of these regulations shall be guilty of an offence and upon conviction be liable to a fine or imprisonment in accordance with section 11 of the Act.

ANNEXURE

TABLE

STANDARDS FOR GRADES OF SOYA BEANS

Nature of deviations	Maximum percentage permissible deviation (m/m)/
	Grade SB1
1	2
(a) Wet pods	0,2%
(b) Foreign matter, including stones, other grain and sunflower seed: Provided that such deviations are individually within the limits specified in items (c), (d) and (e)	4%
(c) Other grain	0,5%
(d) Sunflower seed	0,1%
(e) Stones	1%
(f) Sclerotia	4%
(g) Soya beans and parts of soya beans which pass through the 4,75 mm round hole sieve	10%
(h) Defective soya beans on the 4,75 mm round hole sieve	10%
(i) Soiled soya beans	10%
(i) Deviation in (b) and (f) collectively: Provided that such deviations are individually within the limits of said items	6%

INDUSTRY-WIDE DISPENSATION: THE USE OF THE 1.8MM SLOTTED SIEVE AND THE 4.75MM ROUND HOLE SIEVE DURING THE GRADING OF SOYA BEANS.

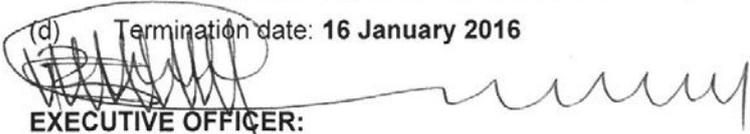

Please refer to your e-mail of the 3rd March 2015.

Permission is hereby granted by the Executive Officer: Agricultural Product Standards in terms of section (3) of the Agricultural Product Standard Act, 1990(Act No. 119 of 1990) to all producers, wholesalers, traders, retailers, importers of Soya Beans, to sell and import Soya Beans whereby the "1.8mm slotted sieve" is used in conjunction with the prescribed 4.75mm sieve round hole sieve: Provided that the prescribed maximum percentage permissible deviations as set out in Annexure with respect to (b) and (i) are increased from 4% to 5% and 6% to 7% respectively.

This permission is subject to the following conditions:

- (a) All other conditions of the regulations shall be complied with.
- (b) It may be withdrawn at any time should a valid complaint received.
- (c) All producers, wholesalers, traders, retailers and importers of Soya Beans indemnify this Directorate and the Department from any detrimental effect, financial or otherwise, which may emanate as a result of this permission.
