

South African

Commercial sorghum quality for the 2024/2025 Season

Acknowledgements

With gratitude to:

- The Sorghum Trust for its financial support in conducting this survey.
- Agbiz Grain and its members for providing to make this survey possible.
- The Crop Estimates Committee (CEC) of the Department of Agriculture (NDA) for providing production related figures.
- South African Grain Information Service (SAGIS) for providing supply and demand figures relating to sorghum.

Introduction

The final commercial sorghum crop figure of the 2024/25 production season as overseen by the National Crop Estimates Liaison Committee (CELC) was 98 000 tons. This figure represents a year-on-year increase of 53% (52 000 tons). The three major sorghum producing provinces this season, namely the Free State, Mpumalanga and Limpopo, contributed 86% to the total crop. The national yield average increased by almost 57% to 3.65 t/ha compared to the previous season.

Figures provided by the CEC.

During the harvesting season, a representative sample of each delivery of sorghum at the various grain intake points, was taken according to the prescribed grading regulations. The sampling procedure for the samples used in this survey is described on page 31. Fifteen (15) composite sorghum samples, representing different production regions, were received and analysed for quality. In addition, nine (9) imported sorghum samples from Brazil and one (1) from the USA were analysed and the results compared to that of the local sorghum crop.

The samples were graded, and test weight and thousand kernel mass determined. Sub-samples were milled and analysed for moisture, crude protein, crude fat and total starch content. After sieving and dehulling by means of a Barley pearler, the fraction of the sample larger than 1.8 mm were milled and Hunter Lab colour analyses conducted. Multi-mycotoxin analyses as well as Image analyses (Length, Width, Elongation (% Width/Length) and Volume/surface area (%)) were also performed on these samples.

This is the eighth annual sorghum crop quality survey performed by The Southern African Grain Laboratory NPC (SAGL). SAGL was established in 1997 on request of the Grain Industry. SAGL is an ISO 17025 accredited testing laboratory and participates in various proficiency testing schemes, both nationally and internationally, as part of our ongoing quality assurance procedures to demonstrate technical competency and international comparability.

The goal of this crop quality survey is the compilation of a detailed database, accumulating quality data collected over several seasons on the national commercial sorghum crop. The data reveal general tendencies and highlight quality differences in the commercial sorghum produced in different local production regions. A detailed database containing reliable analytical data collected over several seasons, is essential in enabling industry to comment on proposed legislative levels and to supply reliable data for targeted research projects.

In addition to the quality information, production figures (obtained from the Crop Estimates Committee (CEC)) relating to hectares planted, tons produced and yields obtained on a national as well as provincial basis, over an eleven season period, are provided in this report. SAGIS (South African Grain Information Service) supply and demand information is provided in table and graph format. Import and export figures over several seasons are also included.

The national sorghum grading regulations as published in the Government Gazette of 8 January 2016 are provided as the last section of the report.

Production

Sorghum is a tropical grass grown primarily in semi-arid regions of the world. Sorghum can grow in areas too dry for maize and is deemed to be the fifth most important grain crop grown in the world (after maize, wheat, rice and barley).

World sorghum production for the 2024/25 season was almost 63.0 million tons, with 62.5 million tons for the 2025/26 season to date. The United States of America remains the largest producer, contributing 8.7 and 11.1 million tons in the 2024/25 and 2025/26 seasons, respectively. See Table 1a for the world sorghum trade (export and import) figures as well as production, consumption and stocks figures in Table 1b.

Note:

Unaccounted: This term includes grain in transit, reporting discrepancies in some countries and trade to countries outside the USDA database.

All trade tables contain Trade Year (TY) data which puts all countries on a uniform, 12-month period for analytical comparisons: Sorghum Oct/Sep (TY 2025/26 corresponds to Jan - Dec 2026).
